We maintain one of the largest inventories of new and used, imported and domestic anchors in the United States.

Anchor Selection

Optimum design of an anchor is influenced by the specific composition of the ocean floor. Basically, we categorize the ocean bottoms into three groups:

1. Mud, or silt, which varies the most in consistency and offers little resistance to forces.
2. Sand, ideally the most consistent, and where anchors specifically designed reach excellent holding efficiency.
3. Rock, or Marl, poor holding ground where an anchor's dead weight is its only asset.

The efficiency of an anchor in a given test is expressed in terms of "Holding Power" per pound of its own weight, not in "Proof test" which indicates physical properties of the material.

The fluke angle of an anchor has a definite effect upon the "Holding Power". The flukes should enter the bottom at an angle that will allow the crown, or head, to penetrate to a depth which can produce maximum efficiency. Additionally, we have determined the following:

1. The angle of fluke penetration in mud bottoms should approximate 50° .
2. In sand the penetration angle should be in the area of 30° .
3. For anchoring in various bottoms a compromise approximating 43° is desirable.

Other considerations in selecting an anchor should include:

1. Convenience for handling and stowing.
2. Aptitude for taking hold.
3. Physical strength.

4. Freedom from fouling, which all anchors do, but some in lesser degrees.
5. Influence developed by the chain's catenary which absorbs shock loads and lowers the angle of pull at the anchor by its weight.

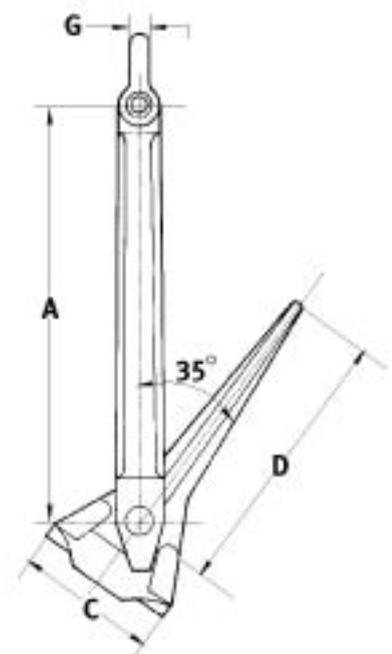

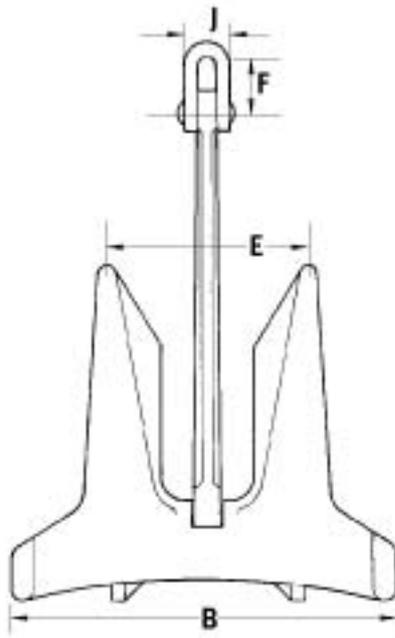

The anchor is the key to effective anchoring or mooring. It is essential to know what to expect from various anchors. The resistance of an anchor to being dragged through a soil has been considered as occurring in two stages: first, biting into the bottom due to the ploughing effect of the flukes, and secondly, maintaining a continuous resistance to drag after it is planted into the bottom.

Holding power is directly proportional to projected fluke area, and shear strength of the bottom material, and inversely proportional to penetration-area resistance. In many cases a smaller anchor with favorable fluke area to weight ratio is more dependable than a heavier anchor. Holding Power for the two most widely used anchors are as follows:

1. Stockless Type anchors, in sand, develop a holding power to weight ratio of seven to one. In mud they develop three to one. The angle of penetration in both cases is 45° .
2. Lightweight Type anchors, in sand, develop a holding power to weight ratio of twenty to one, with the angle of penetration being 30° . In mud they develop nine to one with the angle of penetration being 50° .

The depth of penetration in all preceding cases is compiled from three to seven feet in sand, and from seven to twenty feet in mud. All calculations incorporate a 0° scope angle.

AC-14 Type

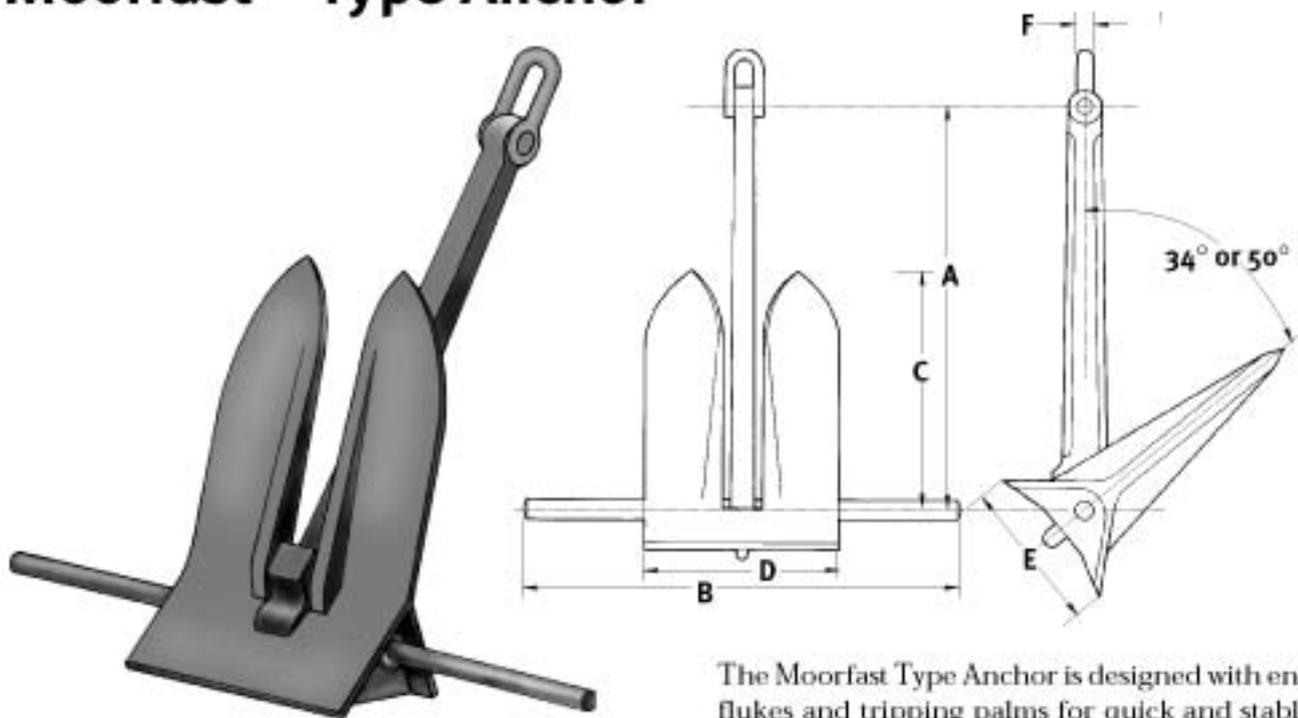

This is a high holding power anchor. The flukes are shaped to insure an immediate grip into the seabed. The small flukes on either side will right the anchor to its proper

position. Its increased efficiency over conventional anchors is maintained on most bottoms including clay and pebbly sand.

Anchor Weight (lb)	A	B	C	D	E	F	G	J

Workboat Anchor

These anchors afford excellent holding power in sand or mud bottoms. As its name states, this is the "working" anchor for numerous offshore vessels.

Snug Stowing® Type Anchor

This anchor simplifies ship bow design, and eliminates the need for cumbersome hawse pipe bolsters. It effectively stoppers the hawse pipe, houses freely with minimum protrudence and provides maximum bearing on the ship's shell. The anchor provides great holding power for most uses.

Stockless Type Anchor

This is the standard anchor for ships that are likely to encounter all types of sea bottoms. It combines the advantages of dead weight for holding in very hard bottoms with the ability to bite and hold in mud and sand. Its features include rugged construction, simple design, with easy handling and stowing.

U.S.N. LWT Anchor

The "hook" head forces the flukes to dig in quickly, and the large fluke design provides tremendous holding power in sand or mud bottoms. Adjuster blocks available to alter fluke angle.

U.S.N. Stockless Anchor

These have the same usage abilities as the stockless anchor, however the flukes are longer. Each fluke is provided with an opening for the insertion of strapping material in order to help secure the anchor to the ship's deck.

Stato Mooring Anchor™

This is an improved permanent type of Mooring anchor developed by the U.S. Navy affording unusual holding strength in either sand or mud bottoms through the use of wedge inserts and palm extensions.

INTERMEDIATE SIZES AVAILABLE UPON REQUEST

Dimensions above are in inches, anchor weights in pounds. Certified drawings of anchors listed above, and of intermediate and larger sizes, may be furnished on request.

Hall Anchor

The Hall anchor has the characteristic of a Stockless anchor.

Additional Anchors

OLD STYLE

Also known as Admiralty, Kedge, Pick and Common Anchor. In great demand before the invention of the stockless anchor, now used mostly on fishing vessels and for permanent moorings, the sharp flukes clutch readily in many types of bottoms. Also available in one arm version

EELLS

This anchor is widely used in salvage operations. With an open back design, it utilizes suction to increase its holding power in soft bottoms.

MUSHROOM

Excellent for permanent moorings, channel buoys and other navigation aids. This anchor takes firm hold and remains fixed under adverse conditions. As anchor oscillates under strains, it buries itself still deeper.

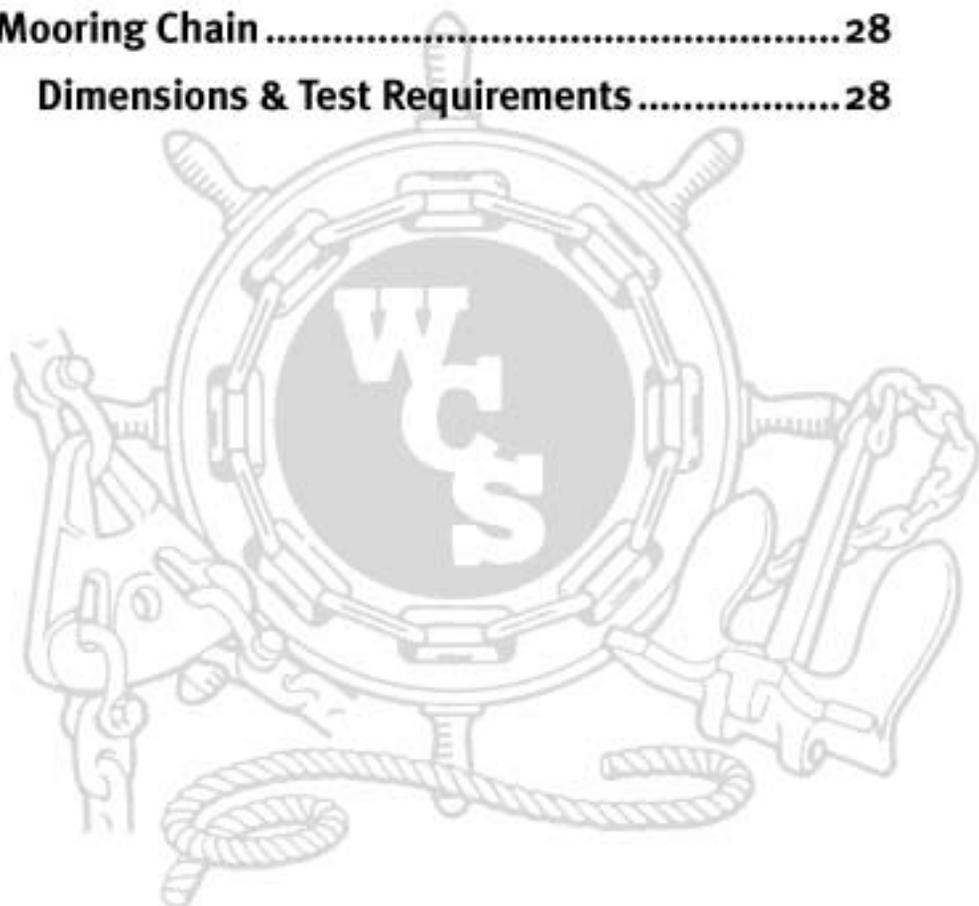

TWO-FLUKED BALANCED ANCHOR

This unique anchor is characterized by having the center of gravity of the flukes below the pivot point. As a result, the flukes and shank are parallel when hoisted. This provides variations in stowage procedures—bottom-mounted stowability.

Di-Lok Chain Dimensions & Test Requirements

No longer manufactured, Di-Lok chain is a forged alloy steel stud link chain with an integral stud with superior strength to weight. Each link is composed of two forged members: a serrated stem member and a socketed member. A cold heat treated serrated member is placed into the hot socketed member and assembled by forging in closed dies.

The unique design of Di-Lok stud link chain allows the use of various alloy steels and heat treatments. The integral stud is formed in the forging of the socketed member and cannot be dislodged.

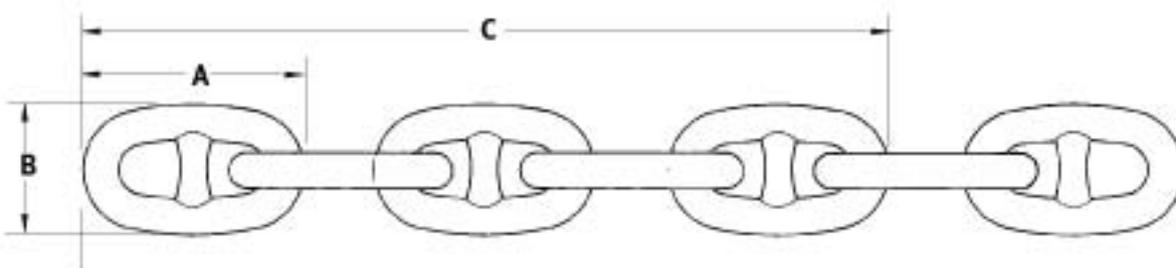

With modification in die design, high strength and super strength Di-Lok chain was manufactured to obtain superior test loads.

Stud Link Chain Dimensions & Test Requirements

How to Determine Chain Link Size

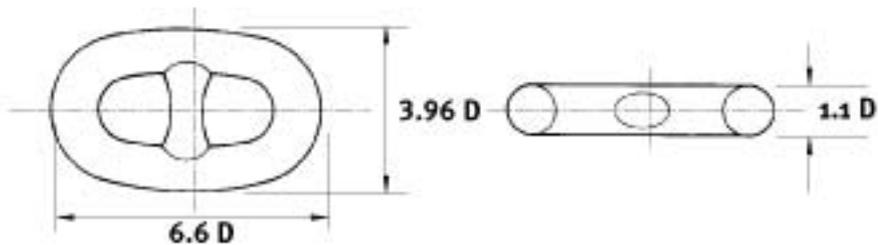

Common Link

6 x Chain Diameter = Length
(eg. 1" Chain = 6" length)

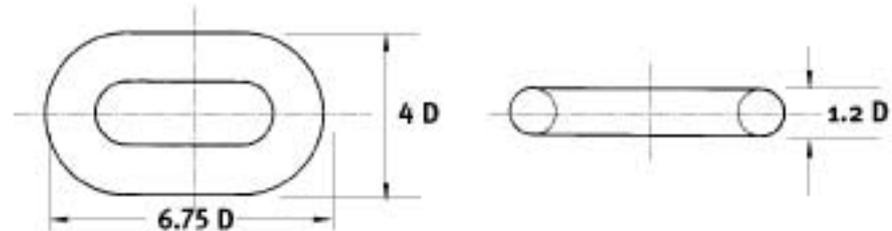

Enlarged Link

6.6 x Chain Diameter = Length

End Link

6.75 x Chain Diameter = Length

Chain Size		Dimensions				Test Requirements						No. of Links per 15 Fm Shot
Inches	mm	Link Length	Link Width	Length Over 5-Links	Weight Per 15 Fmshot (Appx.)	Grade 2		Grade 3		Oil Rig Quality		
						Proof Load	Break Load	Proof Load	Break Load	Proof Load	Break Load	
2-5/8	67	15-3/4	9-7/16	57-3/4	5,820	379,000	530,000	530,000	758,000	540,000	813,000	103

Open Link Mooring Chain (Coast Guard-Type Buoy Chain)

Manufactured in accordance with U.S. Coast Guard Specification Mil-C-22521C, welded buoy chain is an open-link, studless chain manufactured to a minimum quality of Grade 1.

Available with or without end links.

Ask for specifications.

Both the chain links and the end links are manufactured from carbon-steel bar stock, AISI 1030 per MIL-S-16974, with a tensile strength ranging from 71,000 to 92,500 psi.

Chain Length As Required

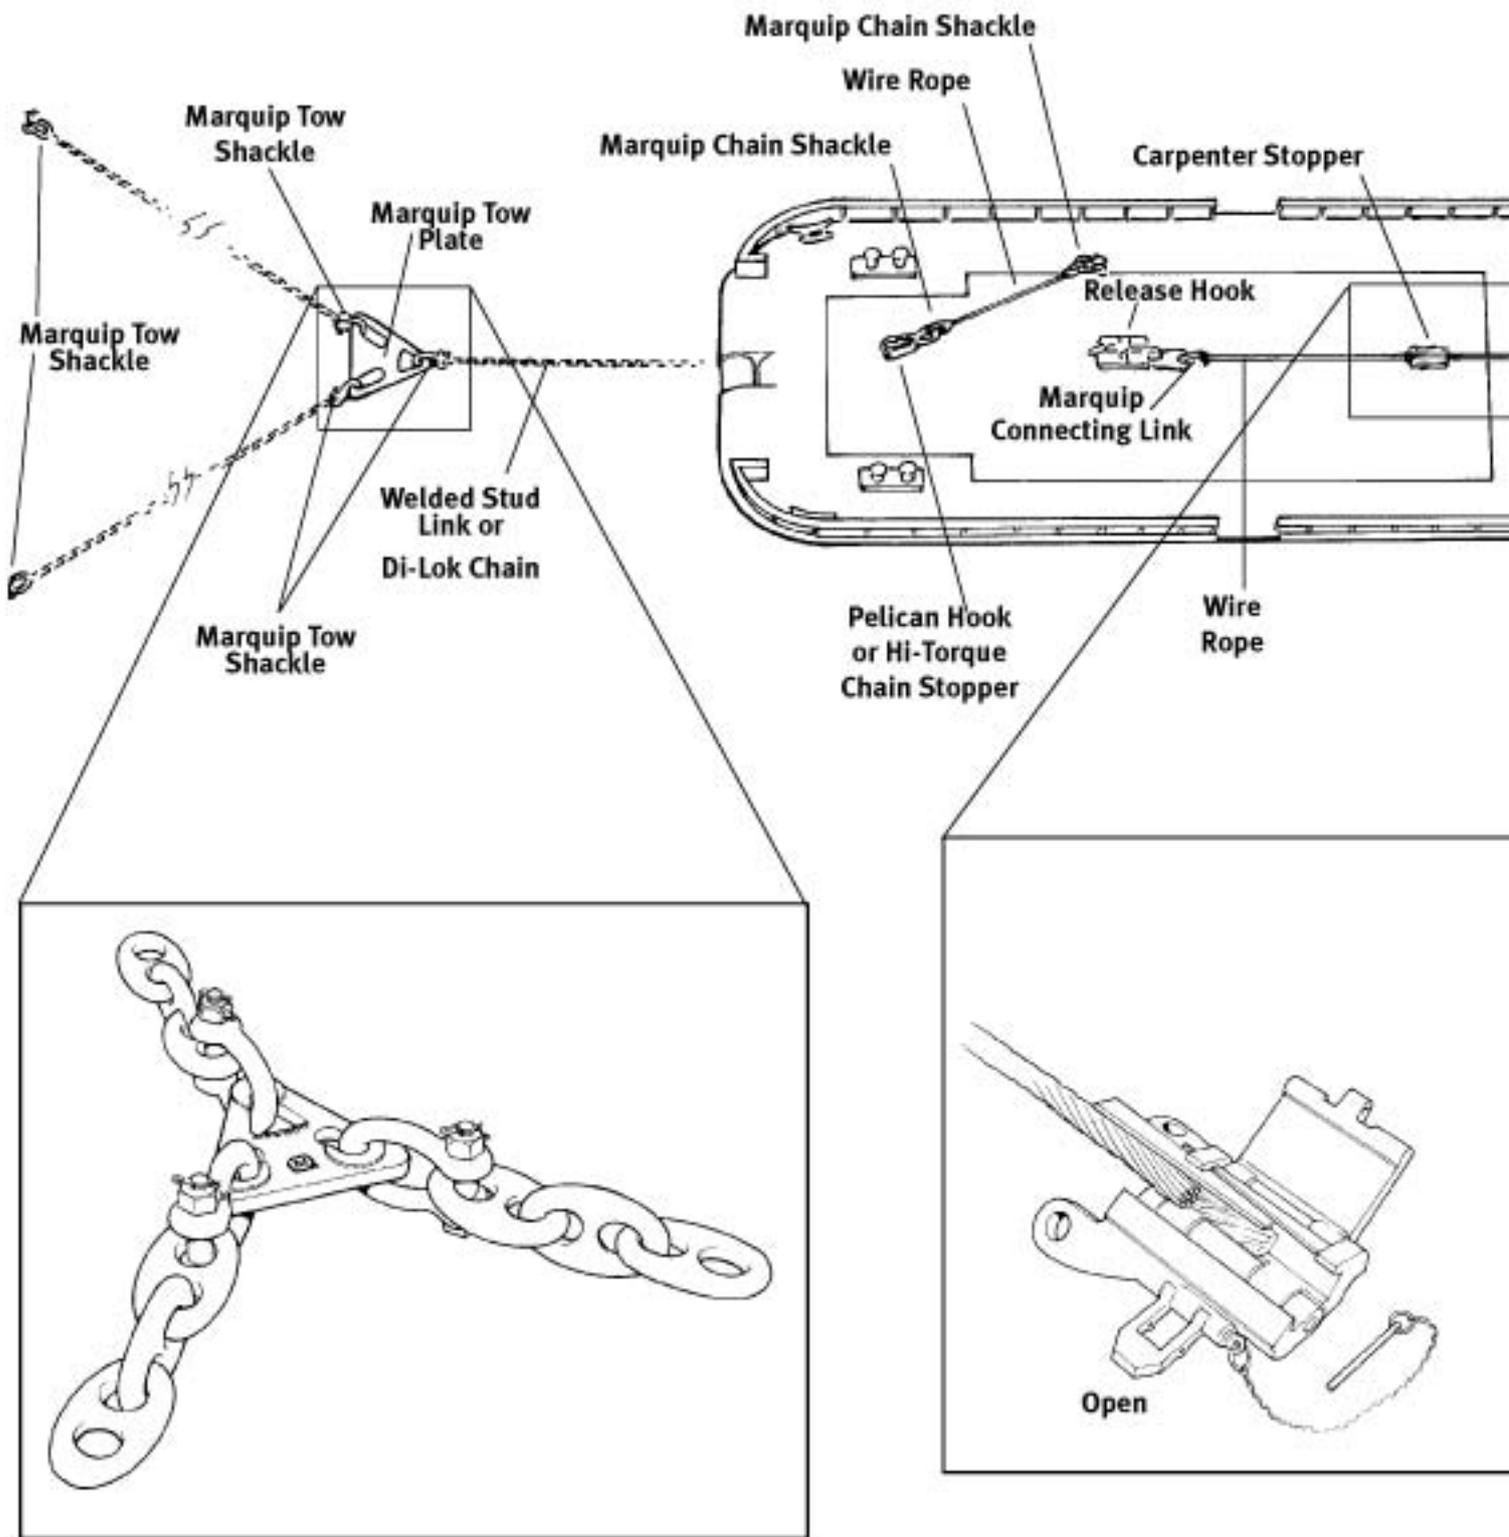

Link Diameter A	Dimensions		Carbon Steel		Alloy Steel		Approx. Weight Per Foot (lbs.)

Detachable Chain Connecting Links

MARQUIP® forged detachable chain connecting links replace bulky shackles and end links. They make better-than-original repair or replacement links, they serve as connecting links for 90' shots of chain, and they ride through hawse pipes and over wildcats as smoothly as normal chain. Made of alloy steel, heat-treated to a tensile strength of approximately 150,000 PSI, they're as strong as or stronger than the chain. The positive-lock assembly consists of a stainless steel pin and lead plug; the pin can be removed with a sledge and drift for disassembly. Proof and break tests surpass USN and ABS requirements; additional certifications are available on request. Links are available in sizes up to 3-1/2". Cast links are also available in sizes up to 4-3/4".

Kenter Joining Link Assembly

The Kenter-type joining link contains three parts plus taper pin and lead plug. The two main halves have numbers to be matched and arrows to be lined up for ease of assembly with the third piece (stud). The two main parts are attached to the ends of the chain in a vertical position and then fitted together (1), and the stud is then slid into place (2), which locks the link. The stud is secured by hammering a tapered pin into the hole drilled diagonally (3) through all three parts of the joining link. This hole is tapered, and when the pin is driven home, a small conical recess (called the "dovetail chamber") is left clear above its head. A lead pellet is hammered broad end first into this chamber (4) so as to fill it completely

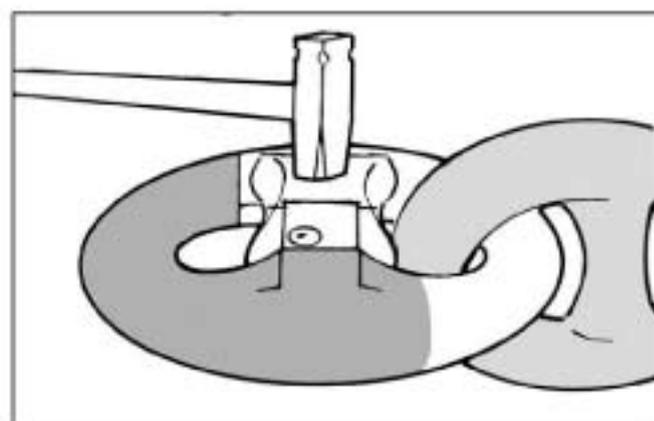

and thereby keep the pin in place. Precaution must be used to prevent flat, small pieces of lead from flying off the joining link into the face or eyes.

Prior to assembly, the internal mating surfaces should be coated with a molybdenum disulphide grease (MIL-G-23549) or an equivalent lithium based grease. When assembling and before inserting the new lead, any remaining lead must be reamed out.

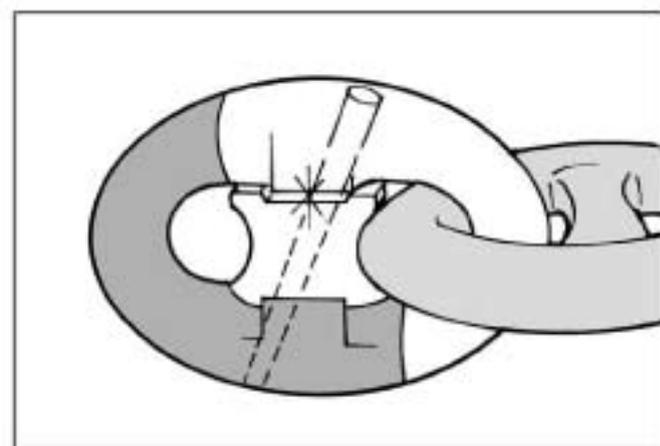

When disassembling, the locking pin is driven out with a "drift". To part the link, a top swage (shaped to the curvature of the link) must always be used between the hammer and link so as to avoid damaging the machined surfaces.

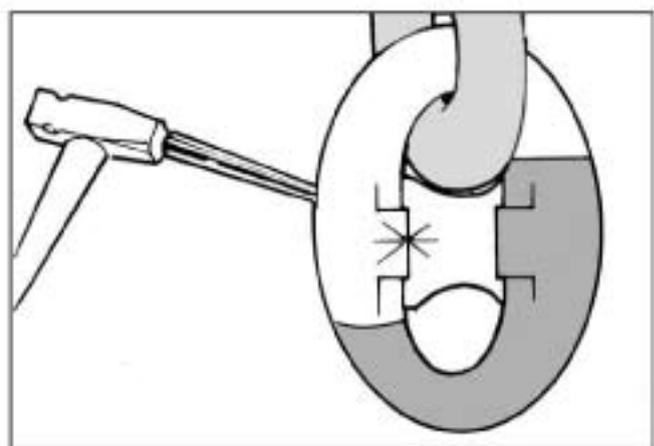

(1) After inserting the first half of link through chain, the other link is inserted in the other and driven together.

(2) The center stud is inserted.

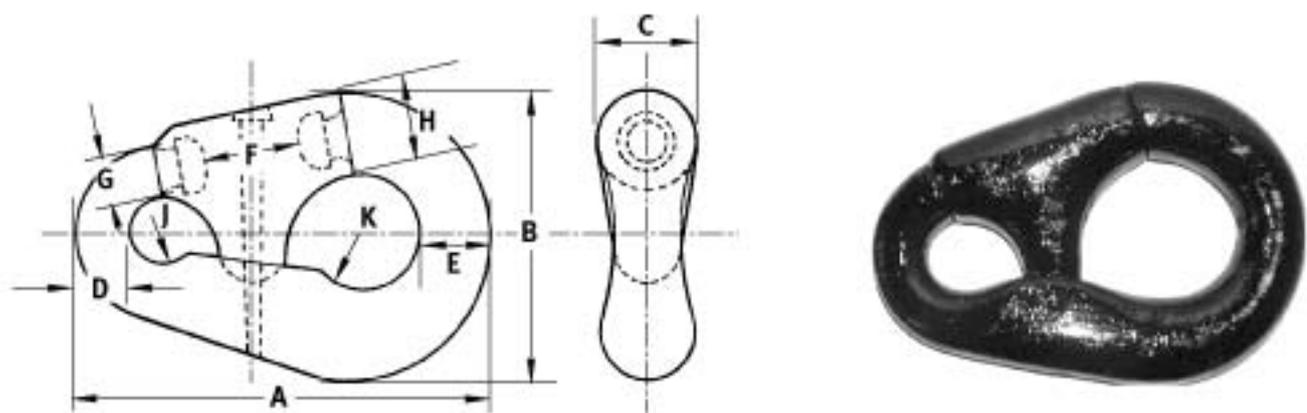

(3) When the center chock is in correct position the taper pin can without a hammer be inserted as shown on the figure which also shows the center chock in correct position.

(4) The taper pin is driven in and is secured by the lead pellet which is inserted into place with a hammer.

End Links

Welded End Link

Welded end links are manufactured in conjunction with welded stud-link chain from alloy-steel bar stock. However, to compensate for the loss of strength due to the absence of the forged stud, they are of a larger wire diameter than the chain with which they are manufactured. Normalizing of the entire chain

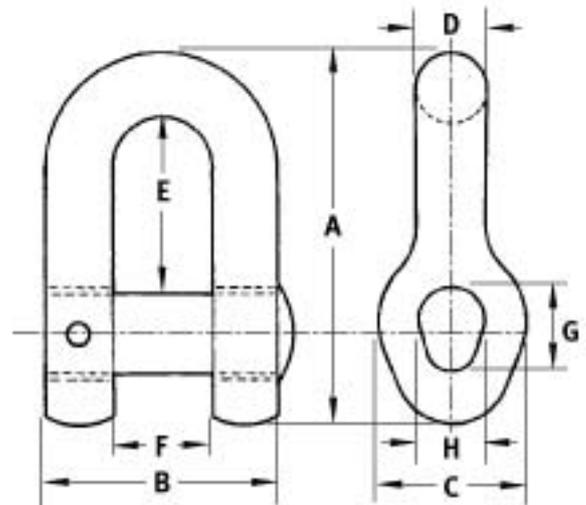

length ensures the same physical strength throughout.

Installed at one or both ends of the chain length, the studless end link enables shackles to be joined directly to the chain — a procedure normally prevented by the presence of a stud.

Naval Mooring Swivel Shackle

Modified Swivel Shackle (Riser)

This modified swivel shackle has two different jaw sizes and is designed to be used in lieu of the standard swivel in a riser. The top end of the riser swivel shackle is required to fit a shackle eye plate of the tension bar while the other end will be sized to fit the upper riser link to which it will attach.

Size	A	B	C	D	E	F	G	H	K	Wt.

Dimensions above are in inches; weight is in pounds.

Retrieving Hardware

Chain Chaser and Grapnel

Used in the recovery of anchors and mooring lines, J-type chain chasers, permanent chain chasers, detachable permanent chain chasers, and grapnels are manufactured as one-piece units from special cast steel which is annealed for maximum unit strength.

The retrieving hardware is designed for use with 2-3/4 to 3-1/2 in. mooring chain and anchors in the 30,000 to 45,000-lb class. All hardware is manufactured with rated testing loads which vary from 150 to 250 tons.

All chasing equipment comes standard with welded hard-facing on contact areas to inhibit wear. Optional treatments include Rapid Solidification Plasma Deposition or R.S.P.D., for superior wear and corrosion resistance, isolated areas or entire castings can be treated.

J-Type Chain Chaser

The J-type chain chaser, complete with swivel shackle, is used to retrieve a rig's anchor when the pendant line is broken. It is a highly refined, stronger version of the conventional chain chaser originally developed for use in the North Sea. The unique design uses a sophisticated beam configuration in place of the usual T-type cross section to optimize quality and reliability.

Permanent Chain Chaser

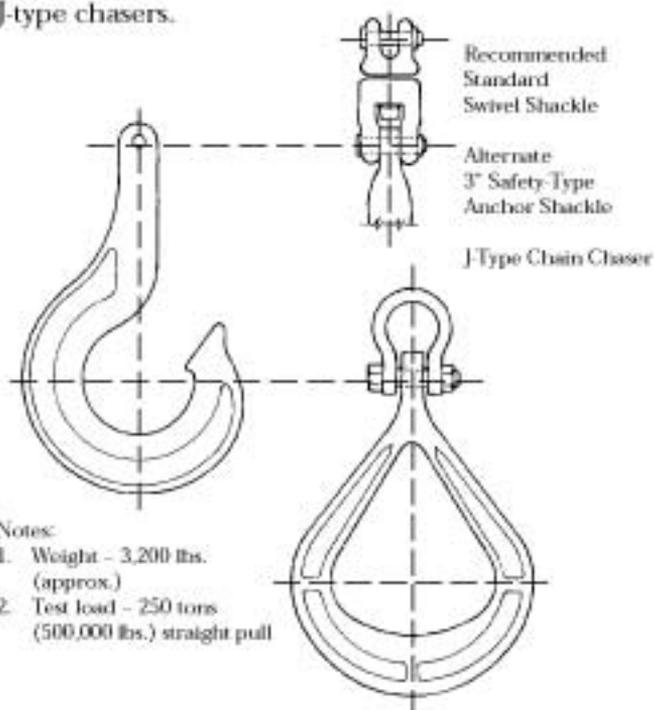

For rigs requiring a permanent-type chaser, we offer a stronger, better engineered version of the conventional chain chaser used in the North Sea. This type of anchor retrieval system eliminates the need for a pendant line buoy system. As with the J-type chaser, the permanent chaser incorporates a beam configuration that lessens the possibility of breaking with a significant decrease in eccentric bending.

Detachable Chain Chaser

A modified conventional permanent chaser designed to make the wear area detachable and replaceable. This innovative design allows the user to hook up easily and replace individual parts that are prone to wear, rather than replace the entire chain chaser.

Grapnel

In order to offer a total coverage for a variety of retrieving applications, WCS offers a four-prong grapnel. This unit is designed to recover lost anchors and mooring lines. The four-prong reduces the outfitting costs, since it is designed to accommodate the same connecting hardware as the permanent and J-type chasers.

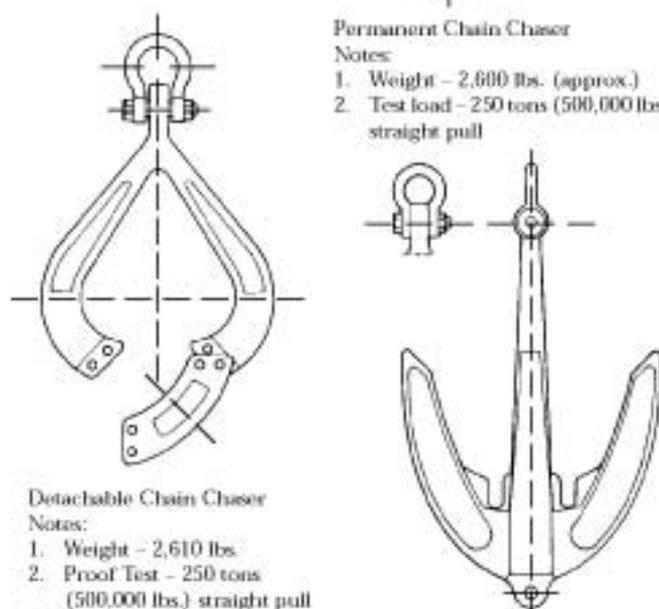

Notes:

1. Weight - 3,200 lbs. (approx.)
2. Test load - 250 tons (500,000 lbs.) straight pull

Permanent Chain Chaser

Notes:

1. Weight - 2,600 lbs. (approx.)
2. Test load - 250 tons (500,000 lbs.) straight pull

Detachable Chain Chaser

Notes:

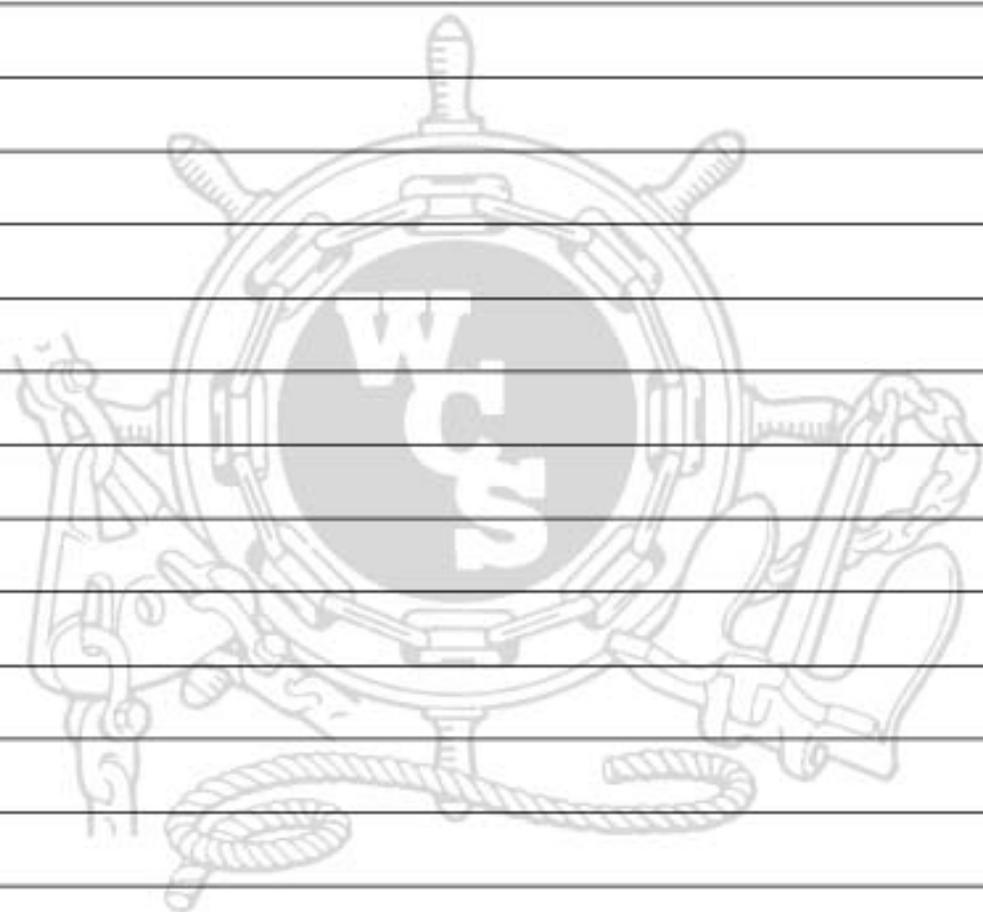

1. Weight - 2,610 lbs.
2. Proof Test - 250 tons (500,000 lbs.) straight pull
3. Working Load Limit - 110 tons (220,000 lbs.)

Four-Prong Grapnel

Notes:

1. Weight - 4,000 lbs. (approx.)
2. Test Load - 150 tons

Notes

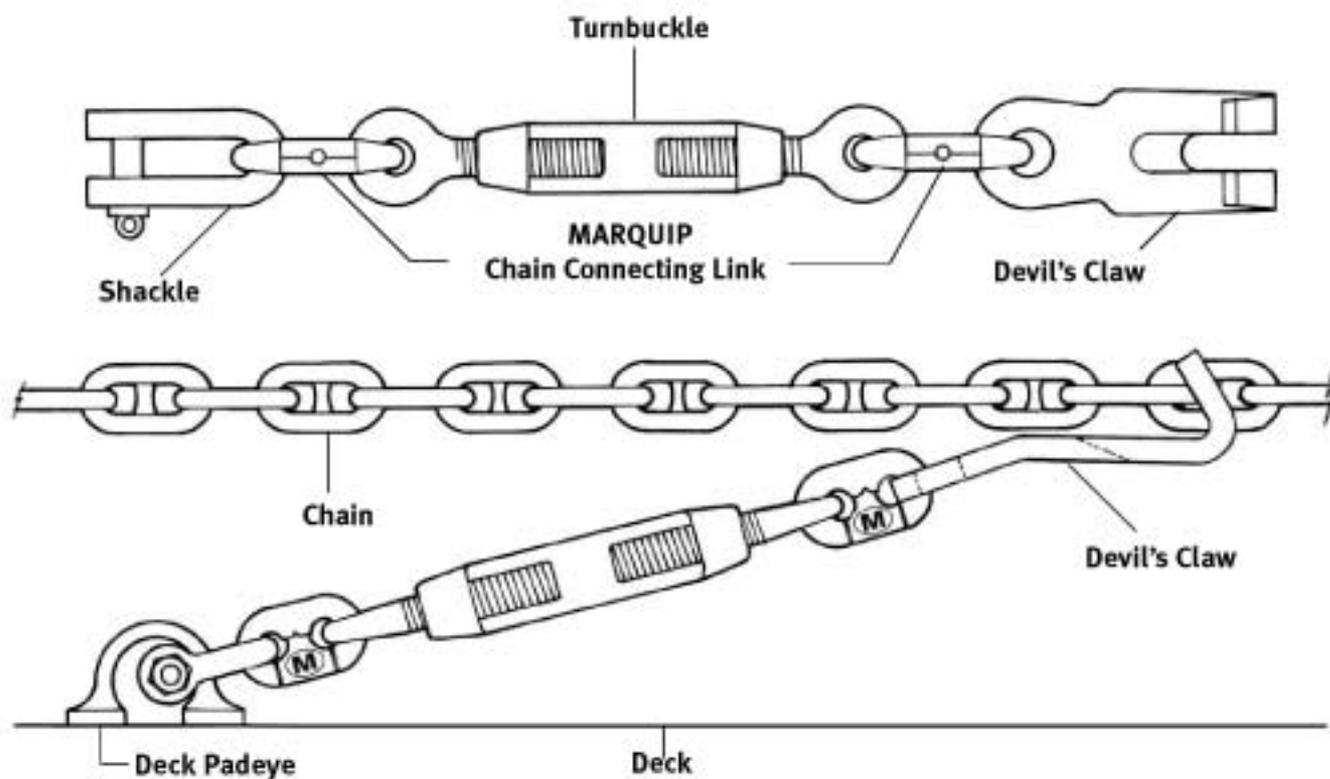

Devil's Claw Chain Stopper Assembly

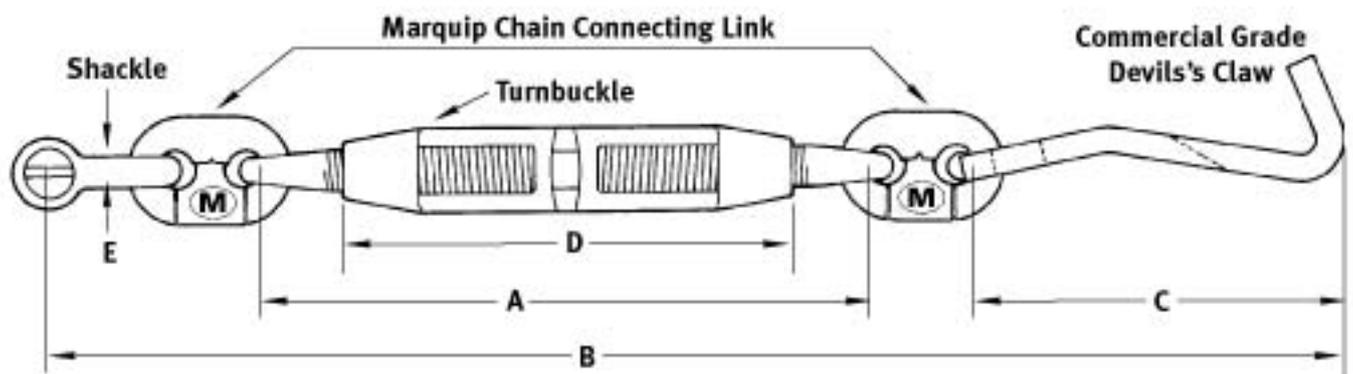

The Devil's Claw Chain Stopper Assembly is designed primarily to assist in securing the anchor at the hawse pipe. Additionally, it can be utilized to help retrieve mooring components. The size of the claw and the jaw opening are directly proportional to the chain size which is to be engaged. When the stopper assembly is used to secure mooring chain, neither the stopper nor the chain is placed in a bending condi-

tion; instead, the loads are arranged in line. Each component of the assembly is forged alloy steel which is heat treated to develop a tensile strength of 150,000 psi. As an option, customers can specify additional handles to be placed at the base of the claw, which increase the ease of handling.

Higher strength devil's claws are available upon request.

Pelican Hook Chain Stopper Assembly

The Pelican Hook Chain Stopper is engineered so that its primary function is to secure the ship's anchor at the hawse pipe. The chain can be disengaged from the stopper by manually deflecting the bail. To facilitate handling, additional handles can be added to the base of the hook should the customer desire.

The chain stopper assembly consists of a shackle, chain connecting links, turnbuckle and pelican hook. Each component is forged from fine grain heat treated alloy steel, with a minimum tensile strength of 150,000 psi.

Hi-Torque Chain Stopper

The Hi-Torque Chain Stopper was designed specifically for interval or end attachment. It will accommodate a wide range of chain, end link and various wire rope rigging applications. Since its introduction the Hi-Torque Chain Stopper has been regarded by supply vessel operators as the most proficient stopping device on the market for anchor handling, buoy retrieving and other applications.

Operationally, the Hi-Torque Chain Stopper is simple and effective. The closing lever pivots between the side plates to provide additional bending sup-

port while allowing the catch plate ample space for movement even when the stopper lies on its side. The shape of the side plates enables the stopper to lie flat on the deck in a closed or open position. There is no load on the deeper pin, which means it can be removed and the stopper can be tripped open with a tripping line attached to the catch plate.

This unique stopper is fabricated from hardened, high tensile alloy steel. Each stopper is proof tested in straight tension.

End Attached

Stopper will accept end link with a 4" inside width or greater.

Middle Attached

Stopper will accept 2-1/2" to 3-1/4" chain or equivalent.

All specifications in pounds and inches, unless otherwise stated.

Ulster Type Chain Stopper

The Ulster Type Chain Stopper is a versatile tool which is designed for multiple applications such as engaging and securing anchor chain, assisting in the stowing of the ship's anchor and accepting the high loads associated with mooring commercial ships, drill ships, semi-submersibles and service vessels.

To prevent the chain from running out during anchor retrieval, the pawl of the stopper should be

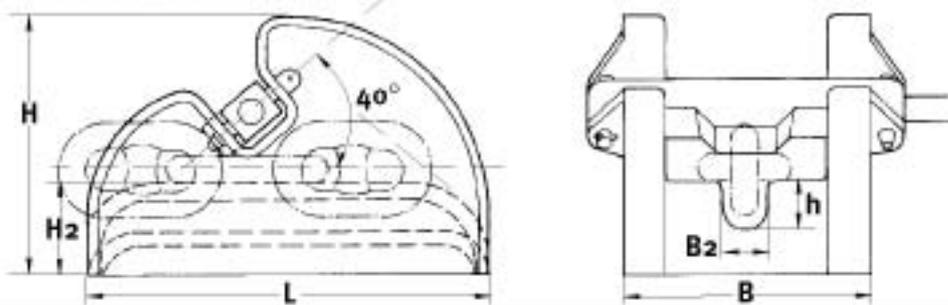

placed inboard. Also, the stopper should be secured to the deck with bolts or by welding. The stoppers are manufactured from high quality cast steel. The pawl is secured with an alloy heat treated hinge pin. Depending on the customer's requirements, the stopper can be equipped with a pawl counterbalance or powered cylinders.

Shackles–Chain Pattern

Showing double nut pin arrangement

210

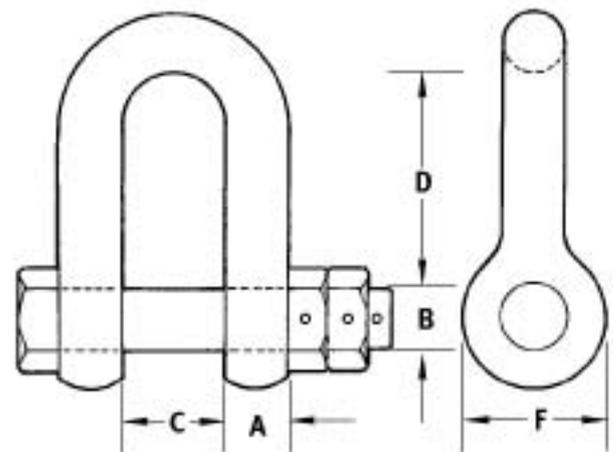

Marquip shackles offer maximum load capacity and safety for marine and construction heavy lift operations utilizing a 6:1 working load limit. Wide jaws facilitate easy installation on chains, flounder or tow plates, tow wires, bell shackles and pad eyes.

Both bails and pins are forged of 4340 extra high strength alloy steel. Each pin is then specially machined and individually precision fitted to its shackle to minimize wear from heavy or surging loads and vibrations. All shackles and pins are heat treated and magnetic particle inspected. Working load limits range from 40 tons to 185 tons, depending on shackle size and style. See specifications.

Safety type pins used on all shackles – all sizes

All through pins are available with double or single safety nuts secured by cap screws, with hex nuts and cotter keys to prevent backing off due to vibrations. Pin ends are tapered.

All certifications are available on request. With our 2,000,000 pound (1,000-ton) tensile strength testing machine, we can provide A.B.S., Lloyd's Shipping, I.L.O. or other cargo bureau certificates as required.

Custom made shackles available to meet your requirements.

Towing Plates

Simpler, stronger, and safer—that's the MARQUIP tow plate. Its patented design lets you rig the bridle with only three shackles, eliminating the extra weight, cost, time, and risk of older-style flounder plates. The No. 2 plate features an extra hole for a tandem shackle to tow additional barges, or to haul

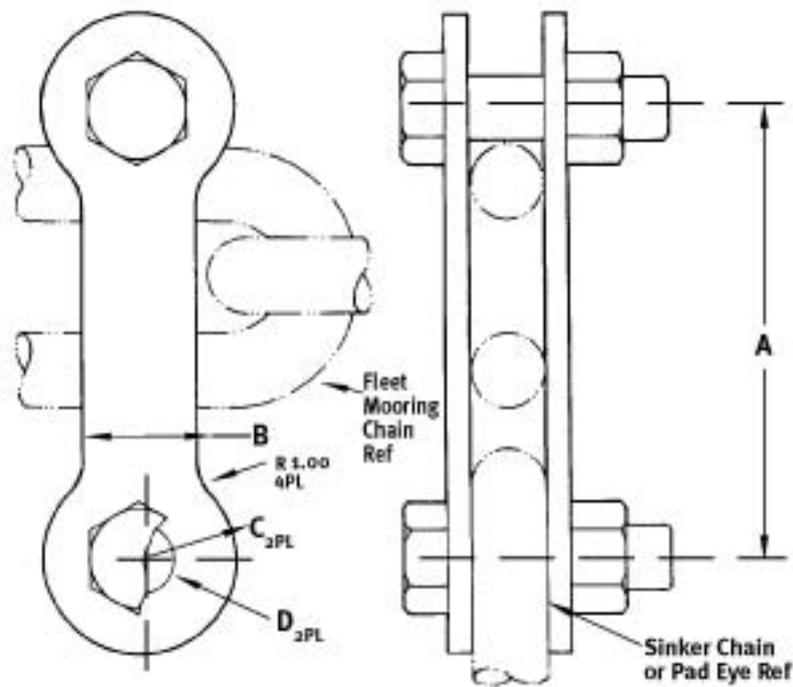

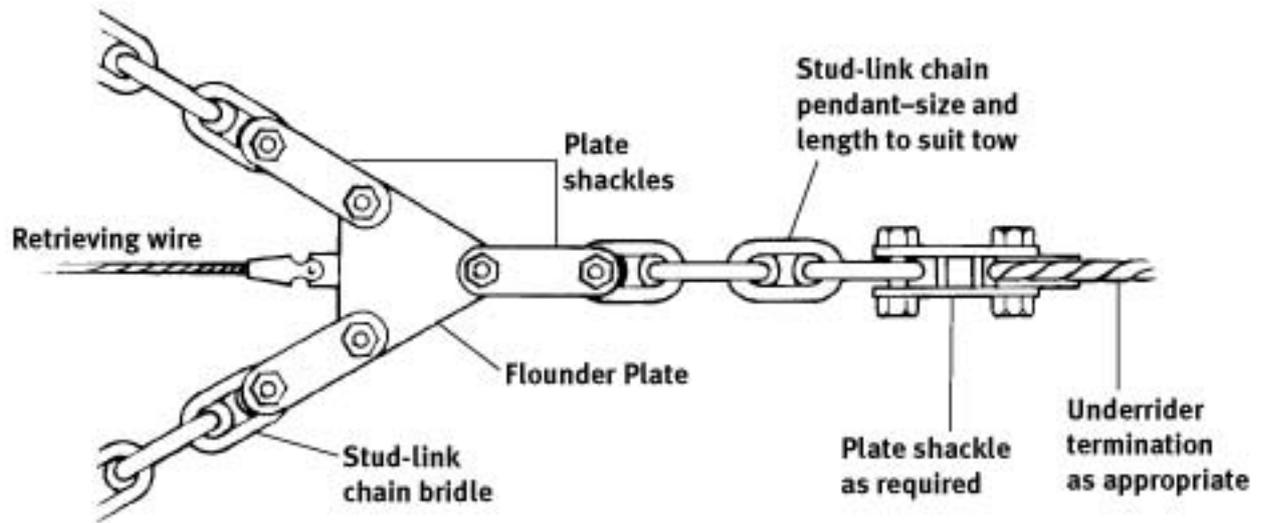

in the bridle. Cast from nickel-chrome steel, MARQUIP plates also provide maximum corrosion resistance. They are available in 300,000-, 485,000-, and 624,000-pound pull test capacities, and can be certified on request.

Buoys & Floats

Bar Riser Buoy	70
Cylindrical Buoy	71
Peg Top Buoy	72
Spherical Buoy	72
Jim Buoy®	73
Inflatable Floats	74

Washington Chain has a constantly changing mix of used buoys.

Bar Riser Chain Type Mooring Buoy

Diameter	Height	Weight In Air	NAVFAC Dwg. No.
9'- 6" O.D.	5'- 0"	7,700 lbs.	620659
10'- 6" O.D.	6'- 6"	9,600 lbs.	620659
10'- 6" O.D.	7'- 6"	10,100 lbs.	620659

Cylindrical Type Buoy

Type 1

Dimensions: A = 5'9" & B = 12'0"

Displacement of Seawater: 20,700 lbs.

Total Buoyancy: 15,750 lbs.

Total Liquid Capacity as container: 2,300 gallons

Weight: 4,950 lbs.

Attachments: 1-3/4" mooring eyes top and bottom
wooden rubbing strips
16" I.D. manways

Type 2

Dimensions: A = 8'0" & B = 14'0"

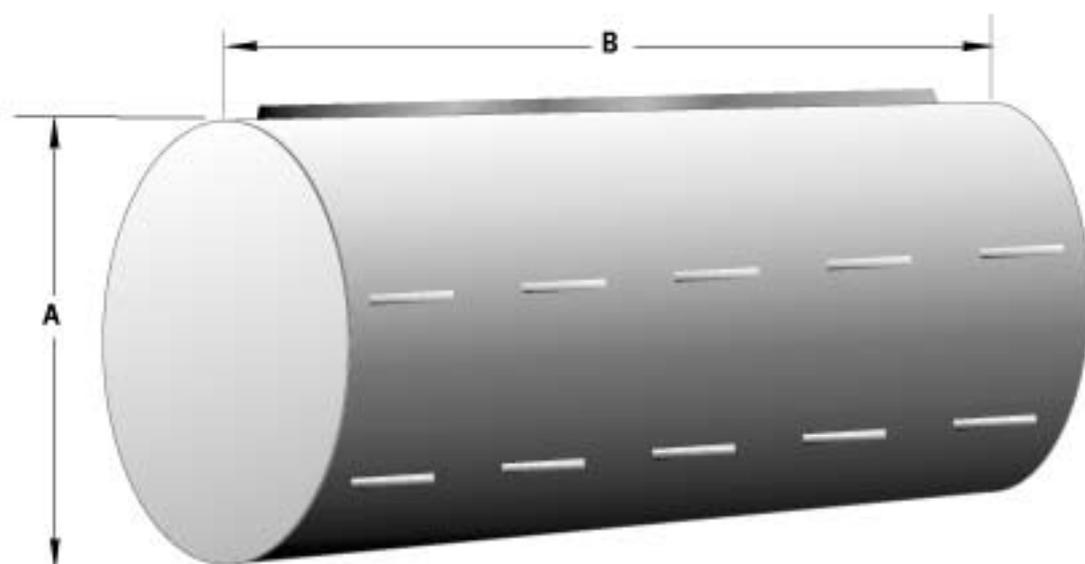

Displacement of Seawater: 45,270 lbs.

Total Buoyancy: 27,670 lbs.

Total Liquid Capacity as container: 5,264 gallons

Weight: 8,960 lbs.

Attachments: mooring eyes top and bottom
wooden rubbing strips
typical manways

Peg Top Buoy

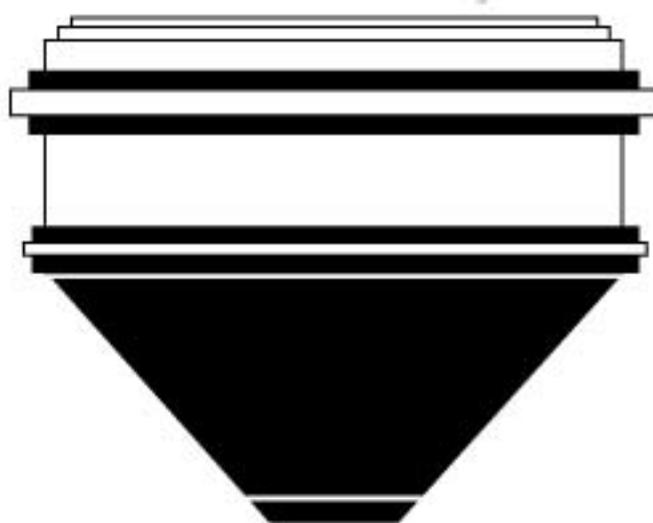

Dimensions: 13'0" dia. x 10'0" high

Displacement of Seawater: 48,100 lbs.

Total Buoyancy: 35,300 lbs.

Weight: 12,800 lbs.

Attachments: wooden rubbing strips
typical manways

Spherical Type Buoy

Dimensions: 58" dia. - 36" dia. - 28" dia. (typical)

58" is standard buoy:

Specifications

- Displacement of Seawater: 3,770 lbs.
- Total Buoyancy: 3,000 lbs.
- Total Liquid Capacity as container: 420 gallons
- Weight: 678 lbs.
- Attachments: 1/4" reinforced steel brackets top and bottom for attaching mooring lines

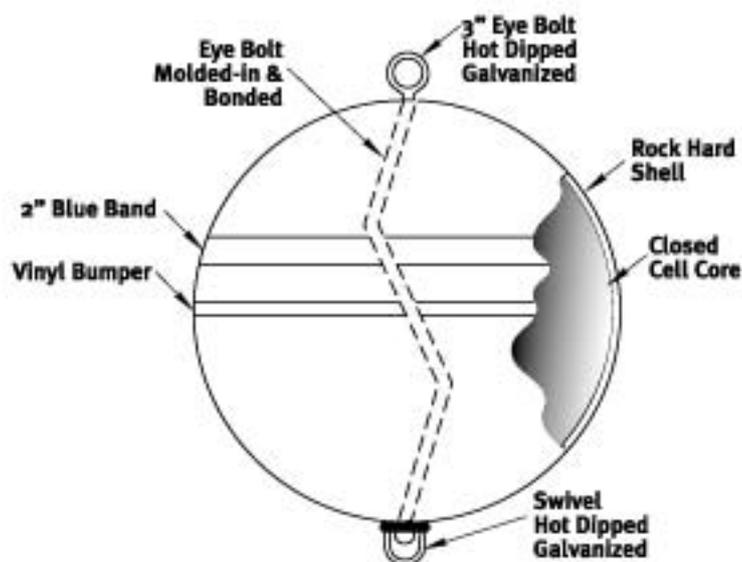

JIM-BUOY® Premium Mark V

The Jim Buoy Premium Mark V utilizes one of the toughest plastics available today. .CJ-37. This fantastic plastic provides a ROCK HARD outer shell of a nominal 1/8" thickness that is absolutely seamless and almost indestructible!

The core is 3 lb. high density polyurethane foam. All eye bolts are permanently bonded inside the buoy during the molding cycle, thus preventing wear and eventual loss of flotation.

JIM-BUOY's Premium Mark V Rock Hard Shell!

The CJ-37 space aged outer shell is almost indestructible—resists the hardest blows, acids and weather extremes!

Release Hooks, Buoy Hooks and Capstans

Washington Chain and Supply, Inc. Quick Release Mooring Hooks are available in nominal loads of 25, 50, 60, 80, 100, 150 and 200 tons.

All motors are explosion proof U.L. approved.

With or without integral power capstan.

Standard designs include single, double, triple & quad mounting.

Each hook of a multiple unit assembly can operate vertically, horizontally, and be released independent of the other hooks.

All hooks are suspended requiring no wearplate thereby eliminating the possibility of sparking.

Lubrication points are provided for ease of maintenance.

Each hook has a safety locking device.

Operation can be either manual or remote by hydraulic or electric control.

Load monitoring indicating and/or recording systems can be employed from a central control station.

Each release hook is tested and certified in our own test facility prior to shipment. Our test machines are capable of testing to 2,000,000 pounds. Our test machines are certified by the American Bureau of Shipping, Lloyds Register, U.S. Salvage Bureau, U.S. Dept. of Labor and OSHA.

Push button switching allows one operator to release any or all hooks in the mooring system.

Our patented release hooks provide a safe, effective, and labor-saving method of ship mooring. Vessel tonnages and their relative distances from shore have increased dramatically over the years, but the Washington Chain release hook design handles virtually any situation. Whether it's a single or multiple-hook model, each is designed to swing completely free up to 180° horizontally and 45° vertically to maintain a straight pull on the lines at all times.

Safety, reliability, strength, and efficiency are the standards we set for our release hooks. Manufactured by Washington Chain since 1970, they consistently exceed every other manufacturer's specifications.

All working parts in our release hooks are heat-treated, cast alloy metals. The units are suspended, with no wearplate to maintain and no dangerous sparks. Any motors required are explosion proof and approved by Underwriters Laboratories (UL) and the Canadian Standards Association (CSA).

All models can release under full load, unlike buoy hooks, which must have slack line to release. As an additional safety feature, we've made a safety latch standard, which prevents the hooks from opening accidentally. The latch can be operated manually or from a remote station, with either a pneumatically or electrically controlled hydraulic release.

Knowing the demanding environments in which our release hooks will operate, we've made maintenance as easy as possible. All of them are hot-sprayed with zinc, then painted or galvanized. Grease fittings are recessed for both safety and ease of lubrication. Periodic maintenance is all that's required to maintain maximum efficiency.

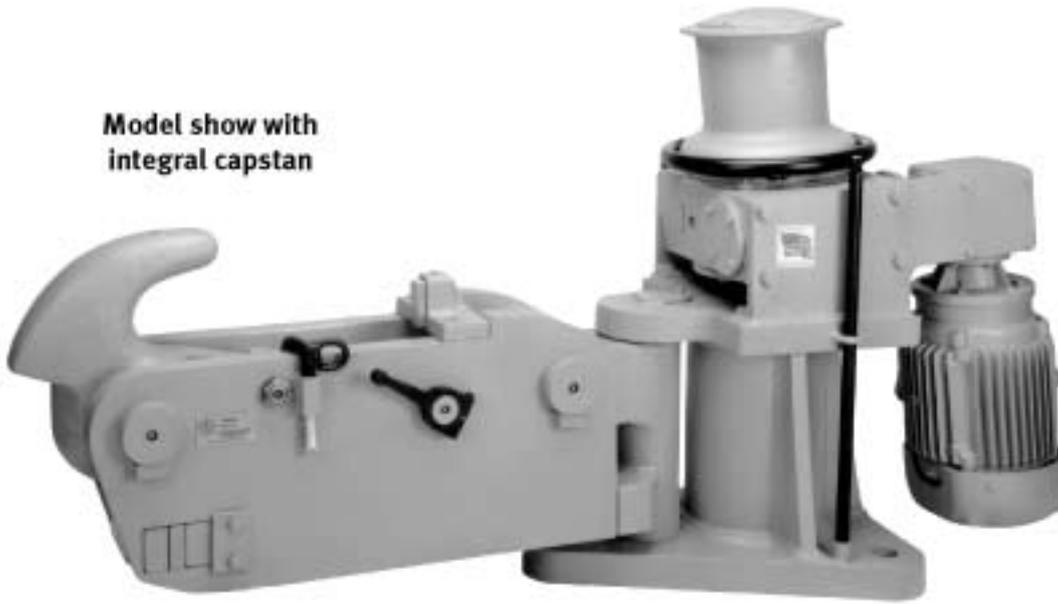

Before leaving our plant, each hook is thoroughly tested. Every one rated 100 tons or less is individually tested to 1.6 times its rated capacity. Larger hooks are tested to American Bureau of Shipping (ABS) standards of 1.3 times rated capacity. Our test machines, which can provide up to 1,000 tons of pull, are recognized and certified by ABS, Lloyds Register of Shipping, the U.S. Department of Labor, and the Occupational Safety and Health Administration (OSHA).

Before any hooks are delivered to your location, we will have provided you with a bottom plate template, allowing you to set the anchor bolts into your structure as you're building, modifying, or repairing it. Then, when the units arrive, you merely bolt them down, and they're ready to operate. If you're replacing existing mooring equipment, we can tailor our bottom plate to fit your specifications, saving you substantial extra work.

Release hooks available in single, double, triple or quadruple configurations.

Single Release Hooks

Model show with
integral capstan

Note: Hook can swing 180° horizontally and can elevate 45° vertically.

Users of our release hooks and capstans:

AMOCO Oil	Magna Copper	Shell Oil
ARCO	Markey Machine	Sunco Oil
Baltimore Gas & Electric	J.M. Martinac	Tesoro
British Petroleum	Mitsubishi	Texaco
Chevron	McDermott	Transmountain
Citgo Oil	Mobil Oil	Union Carbide
Concrete Technology	Murphy Oil	Union Chemical
Conoco Oil Co.	Neptune Terminal	Union Oil
Crowley	N. American Shipbuilding	U.S. Army
Equilon	Penex Oil	U.S. Coast Guard
Express Marine	Port of L.A.	U.S. Navy
Exxon	Port of Tacoma	Westshore Terminals
General Tool	SeaLand Transportation

Triple Release Hooks

Note: Hook can swing 140° horizontally and can elevate 45° vertically.

You will find our hooks and capstans in:

Canada	Russia
Chile	Taiwan
France	Thailand
Indonesia	U. S. A.
Japan	Venezuela
Kuwait	West Indies
Mexico	

Ask for our Release Hook Catalog

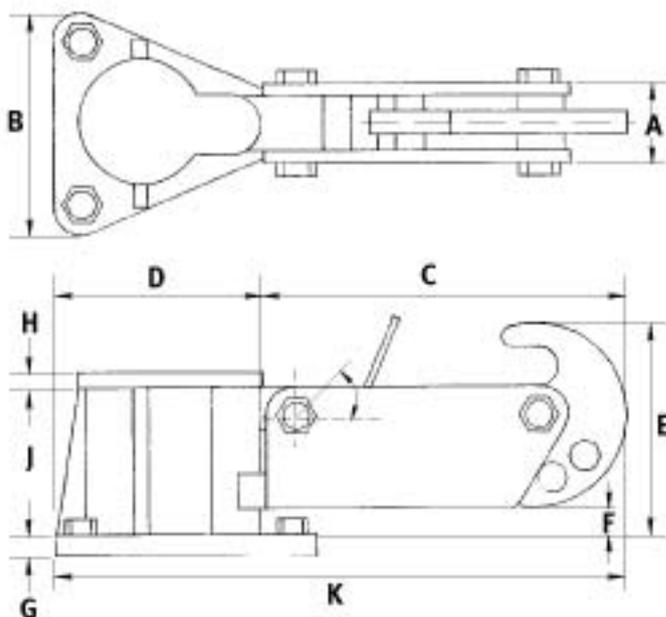

Rotary Release Hooks

All of our standard air- and hydraulic-release hooks provide good dampening against the sudden shock of line release under load. These rotary-release models, though, go a step further. By spinning freely, they remove the strain from the hook itself, rather than using a bumper pad to absorb recoil. This provides for smoother release and allows the hooks to handle higher loads.

In addition, the smoother release prolongs the life of both the hook itself and the mooring lines it handles. Of course, like our other models, rotary release hooks are made of heat-treated alloy steel, are hot-sprayed with zinc before finishing, and include the same safety features and ease of maintenance.

Note:

Hook in single configuration can swing 180° horizontally and can elevate 45° vertically. Each hook in a double hook configuration can swing 140° horizontally and can elevate 45° vertically.

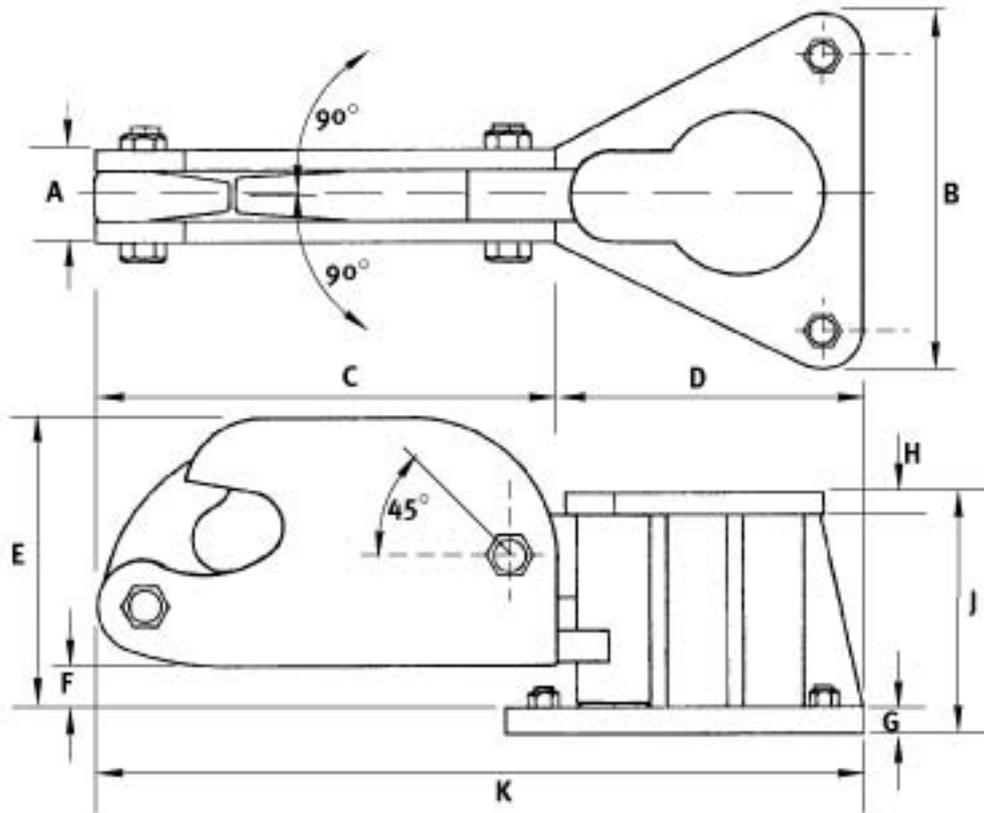

Hook Type	Line Size	Nominal Load Per Hook			Total Load Per Unit			Hook Weight			Weight Hook(s) w/Base

Note: All dimensions in inches

Captive Release Hook (Light Towing Hook)

Recognizing that operators' needs vary, we also offer a "captive" release hook for light towing. This hook is designed to prevent the accidental release of the tow line should it go slack, and allows for rapid hookup and release of tug-and-barge combinations.

Note: Hook can swing 180° horizontally and can elevate 45° vertically.

Ask for our Release Hook Catalog

NOTE: All dimensions in inches.

Buoy Release Hook

With world shipping moving towards larger and more sophisticated vessels especially for petroleum products, a device for fast and efficient mooring has become a necessity.

The quick release mooring hook manufactured by Washington Chain and Supply, Inc. fulfills all the requirements for a positive labor saving method of mooring ships.

Available in proof tests of 300,000 and 400,000 pounds. Total Weight: 375 pounds.

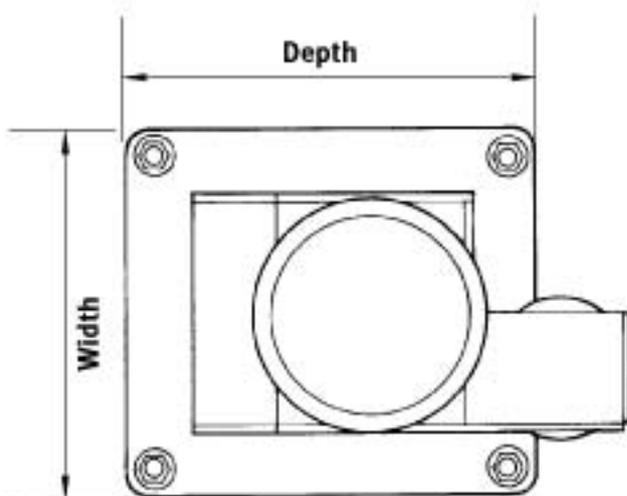

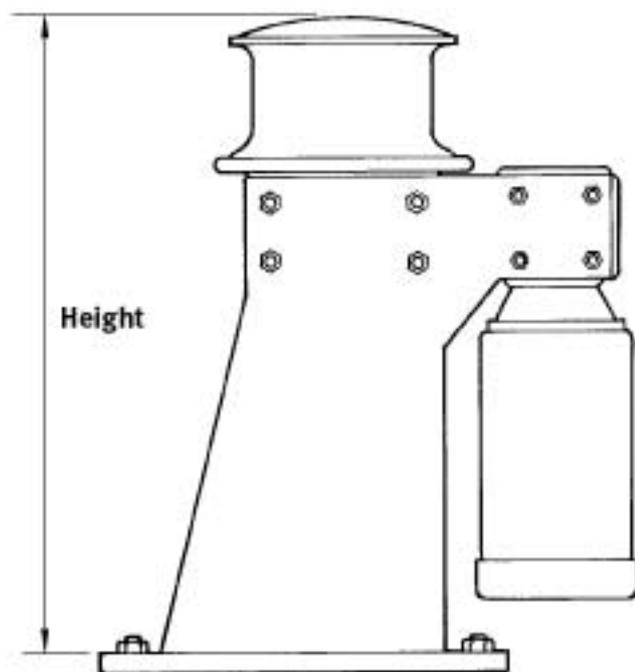

Special opening Quick Release Hook (400,000 pounds) Weight: 570 pounds.

Meets MIL-H-11884A

Dimensions above are in inches; weight is in pounds.

Capstans

We manufacture a variety of capstans, both freestanding and as an integral part of another unit. Our standard models will meet the needs of almost any application, but custom fabrication is also available to accommodate specific requirements. All models are available with either one-or-two-way drive, and with a variety of capstan head sizes and styles to match your specifications.

WARNING

Low and high carbon steel welded and weldless chain and attachments are not to be used for overhead lifting purposes or where its failure is likely to cause damage to property or persons.

Washington Chain can custom fabricate and proof test to your specifications. We carry a vast inventory of domestic and import chain and fittings.

General Information

Definitions

RATED LOAD VALUE – The maximum recommended load that should be exerted on the item. The following terms are also used for the term Rated Load: "WLL," "Working Load Limit," and the "Resultant Safe Working Load." All rated load values, unless noted otherwise, are for in-line pull with respect to the centerline of the item.

WORKING LOAD LIMIT – The "Working Load Limit" is the maximum load in pounds which should ever be applied to chain, when the chain is new or "in as new" condition, and when the load is uniformly applied in direct tension to a straight length of chain.

PROOF LOAD – The average load to which an item may be subjected before visual deformation occurs or a load that is applied in the performance of a proof test.

PROOF TEST – The "Proof Test" is a term designating the tensile test applied to new chain for the sole purpose of detecting injurious defects in the material or manufacture. It is the load in pounds which the chain has withstood under a test in which the load has been applied in direct tension to a straight length of chain.

MINIMUM ULTIMATE LOAD – The "Minimum Ultimate Load" is the minimum load at which new chain will break when tested by applying direct tension to a straight length of chain at a uniform rate of speed in a testing machine.

SHOCK LOAD – A resulting load from the rapid change of movement, such as impacting or jerking, of a static load. A Shock Load is generally significantly greater than the static load.

SAFETY FACTOR – An industry term denoting theoretical reserve capability. Usually computed by dividing the catalog stated ultimate load by the catalog stated working load limit and generally expressed as a ratio, for example 5 to 1.

ATTACHMENTS – Any attachments, such as hooks or links, should have a rated "Working Load Limit" at least equal to the chain with which it is used.

CAUTION – Only alloy chain should be used for overhead lifting applications.

It must be recognized that certain factors in the usage of chain and attachments can be abusive and lessen the load that the chain or attachments can withstand. Some examples are twisting of the chain, disfigurement, deterioration by straining, usage, weathering and corrosion, rapid application of load or jerking applying excessive loads, and sharp corners cutting action.

Due to the crushing effect Grab Hooks have upon chain, the design factor for all assemblies must be reduced by 20% with Grab Hook applications.

All ratings given in tons refer to short tons of 2,000 lbs.

Chain Inspection

INSPECTION AND REMOVAL FROM SERVICE PER ANSI B30.9

FREQUENT INSPECTION

Normal Service - Monthly

Severe Service - Daily to Monthly

Check chain and attachments for wear, nicks, cracks, breaks, gouges, stretch, bend, weld splatter, discoloration from excessive temperature, and throat openings of hooks.

1. Chain links and attachments should hinge freely to adjacent links.
2. Latches on hooks, if present, should hinge freely and seat properly without evidence of permanent distortion.

PERIODIC INSPECTION – INSPECTION RECORDS REQUIRED

Normal Service - Yearly

Severe Service - Monthly

This inspection shall include everything in a frequent inspection plus each link and end attachment shall be examined individually, taking care to expose inner link surfaces of the chain and chain attachments.

1. Worn links should not exceed values given in table 1 or recommended by the manufacturer.
2. Sharp transverse nicks and gouges should be rounded out by grinding and the depth of the grinding should not exceed values in Table 1.
3. Hooks should be inspected in accordance with ASME B30.10.
4. If present, latches on hooks should seat properly, rotate freely, and show no permanent distortion.
5. Chains use OSHA and ASME regulations and safety information.

Table 1

MAXIMUM ALLOWABLE WEAR AT ANY POINT OF LINK	
Normal Chain or Coupling Link Cross Section (in.)	Maximum Allowable Wear Diameter (in.)
9/32	.037
3/8	.052
1/2	.069
5/8	.084
3/4	.105
7/8	.116
1	.137
1-1/4	.169

REFER TO ANSI B30.9 FOR FULL DETAILS

Note: Exposure to temperatures in excess of 400° (F) or 200° (c) reduce the Working Load Limit.

SEE APPLICATION AND WARNING INSTRUCTIONS

S-316A

S-317A

S-318A

S-326A

S-319

S-320

S-320N

S-322

- For hooks used in frequent load cycles or pulsating load, the hook and threads should be periodically inspected by magnetic particle or Dye Penetrant. (Note: Some disassembly may be required.)
- Never use a hook whose throat opening has been increased, or whose tip has been bent or twisted.
- Never use a hook that is worn beyond designated limits.
- Remove from service any hook with a crack, nick, or gouge.
- Never repair, alter, rework, or reshape a hook by welding, heating, burning, or bending.
- Never side load, back load, or tip load a hook. (See Below.)

Side Load
Wrong

Back Load
Wrong

Tip Load
Wrong

- Do not swivel the S-322 or S-326A swivel hook while it is supporting a load.
- The use of a latch may be mandatory by regulations or safety codes; e.g., OSHA, MSHA, ANSI/ASME B30, Insurance, etc.
- Efficiency of synthetic sling material may be reduced when used in eye or bowl of hook.

Right
Figure 1

Wrong
Figure 2

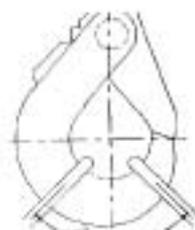

Figure 3

- Always make sure the hook supports the load. (See Figure 1.)
- Do not use hook tip for lifting. (See Figure 2.)
- When placing two (2) sling legs in hook, make sure the angle from vertical to the leg nearest the hook tip is not greater than 45 degrees, and the included angle between the legs does not exceed 90 degrees.* (See Figure 3.)
- See ANSI/ASME B30.10 "Hooks" for additional information.

*For two legged slings with angles greater than 90°, use an intermediate link such as a master link or bolt type shackle to collect the legs of the slings. The intermediate link can then be placed over the hook to provide an in-line load on the hook. This approach must also be used when using slings with three or more legs.

WARNING

- Loads may disengage from hook if proper procedures are not followed.
- A falling load may cause serious injury or death.
- Never use hook unless hook and latch are fully closed and locked.
- Keep body parts clear of pinch point between hook tip and hook latch when closing.
- Do not use hook tip for lifting.
- Shank threads may corrode and/or strip and drop the load.
- Never apply more force than the hook's assigned Working Load Limit (WLL) rating.
- See OSHA Rule 1926.550 (g) for personnel hoisting by cranes or derricks. A Crosby 316, 317, 318, or 326 hook may be used for lifting personnel.
- Use only genuine Crosby parts as replacements.
- Read and understand these instructions before using hook.

Crosby® Forged Eye Bolt

SEE APPLICATION AND WARNING INSTRUCTIONS

Regular Nut Eye Bolt
G-291

Shoulder Nut Eye Bolt
G-277

Machinery Eye Bolt
S-279

Important Safety Information - Read & Follow Inspection/Maintenance Safety:

- Always inspect eye bolt before use.
- Never use eye bolt that shows signs of wear or damage.
- Never use eye bolt if eye or shank is bent or elongated.
- Always be sure threads on shank and receiving holes are clean.
- Never machine, grind, or cut eye bolt.

Assembly Safety:

- Never exceed load limits specified in Table I.
- Never use regular nut eye bolts for angular lifts.
- Always use shoulder nut eye bolts (or machinery eye bolts) for angular lifts.
- For angular lifts, adjust working load as follows:

Direction of Pull	Adjust Working Load
45 degrees	30% of rated working load
90 degrees	25% of rated working load

- Never undercut eye bolt to seat shoulder against the load.
- Always countersink receiving hole or use washers to seat shoulder.
- Always screw eye bolt down completely for proper seating.
- Always tighten nuts securely against the load.

WARNING

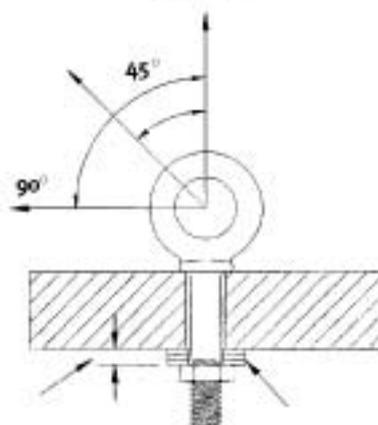

- Loads may slip or fall if proper eye bolt assembly and lifting procedures are not used.
- A falling load can seriously injure or kill.
- Read and understand both sides of these instructions, and follow all eye bolt safety information presented here.
- Read, understand, and follow information in diagrams and charts below before using eye bolt assemblies.

Table 1 (In-Line Load)

Size (in.)	Working Load Limit (lbs.)
1/4	650
5/16	1,200
3/8	1,550
1/2	2,600
5/8	5,200
3/4	7,200
7/8	10,600
1	13,300
1-1/4	21,000
1-1/2	24,000

Shoulder Nut Eye Bolt – Installation for Angular Loading

IN-LINE

- The threaded shank must protrude through the load sufficiently to allow full engagement of the nut.

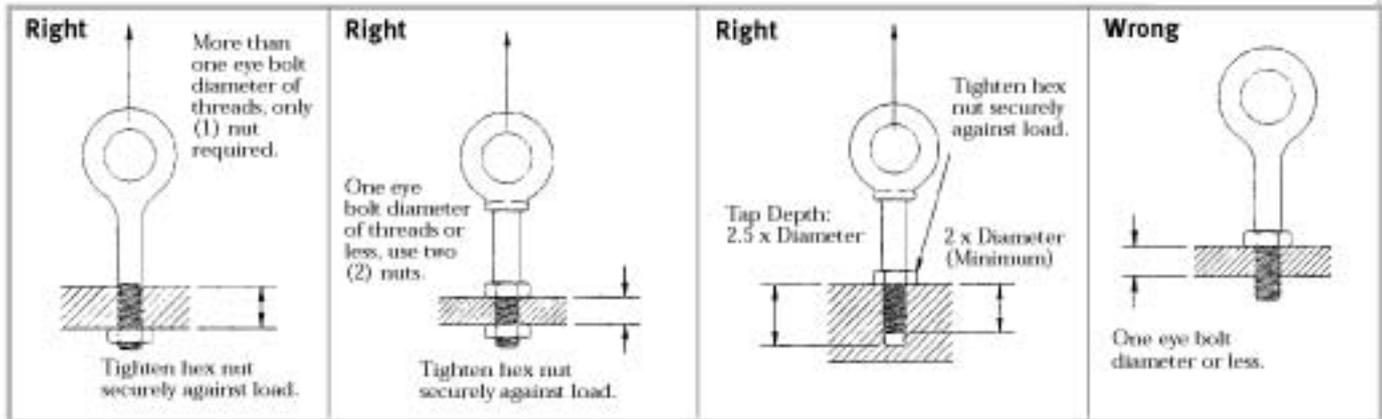

- If the eye bolt protrudes so far through the load that the nut cannot be tightened securely against the load, use properly sized washers to take up the excess space BETWEEN THE NUT AND THE LOAD.

- Thickness of spacers must exceed this distance between the bottom of the load and the last thread of the eye bolt.

- Place washers or spacers between nut and load so that when the nut is tightened securely, the shoulder is secured flush against the load surface.

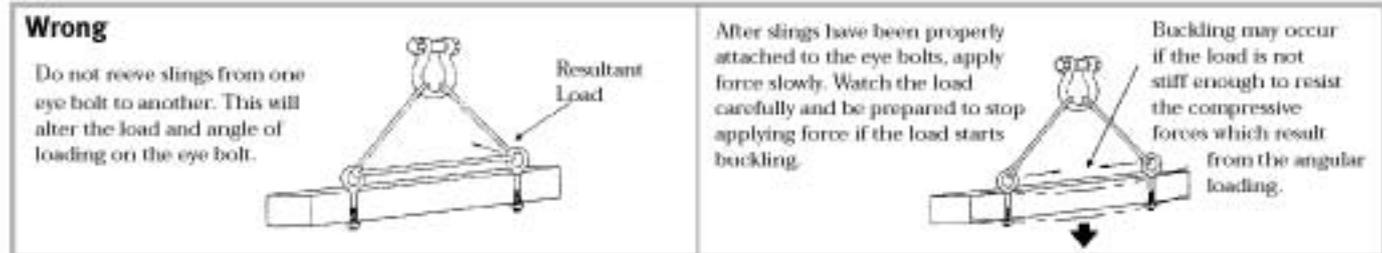

IMPORTANT – Read and understand these instructions before using eye bolts.

Regular Nut & Shoulder Nut Eye Bolt – Installation for In-Line Loading

Operating Safety

- Always stand clear of load.
- Always lift load with steady, even pull - do not jerk.
- Always apply load to eye bolt in the plane of the eye - not an angle.
- Never exceed the capacity of the eye bolt - see Table I.
- When using lifting slings or two or more legs, make sure the loads in the legs are calculated using the angle from the vertical to the leg and properly size the shoulder nut or machinery eye bolt for the angular load.

Machinery Eye Bolt – Installation for In-Line & Angular loading

These eye bolts are primarily intended to be installed into tapped holes.

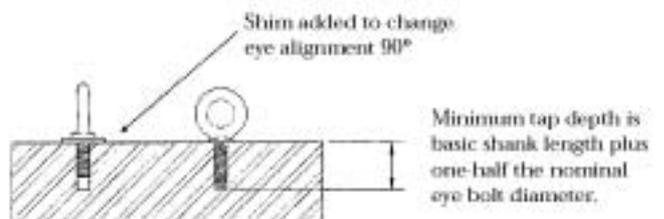

1. After the loads on the eye bolts have been calculated, selection the proper size eye bolt for the job.
For angular lifts, adjust working load as follows:

Direction of Pull	Adjust Working Load
45 degrees	30% of rated working load
90 degrees	25% of rating working load

2. Drill and tap the load to the correct sizes to a minimum depth of one-half the eye bolt size beyond the shank length of the machinery eye bolt.
3. Thread the eye bolt into the load until the shoulder is flush and securely tightened against the load.
4. If the plane of the machinery eye bolt is not aligned with the sling line, estimate the amount of unthreading rotation necessary to align the plane of the eye properly.
5. Remove the machinery eye bolt from the load and add shims (washers) of proper thickness to adjust the angle of the plane of the eye to match the sling line. Use Table II to estimate the required shim thickness for the amount of unthreading rotation required.

Table II

Eye Bolt Size (in.)	Shim Thickness Required to Change Rotation 90° (in.)
1/4	.0125

G-30

G-43

G-70

Welded Graded Chain

Welded graded chain is an industrial grade chain used extensively in rigging, towing and overhead lifting applications. CM® graded chains are manufactured in accordance with the NACM Specification for chain, ASTM Standard A391 and ASTM Standard A413. The standardized grade designations are 30, 43 and 70 for carbon steel chain, and 63 and 80 for alloy steel chain.

The grade number relates to the strength level of the chain, with the grade number increasing as the strength of the chain increases.

Only alloy chain is designed for overhead lifting. The other grade designated chains are not made from alloy steel and should not be used for overhead lifting.

Stainless Steel Chain

For additional information, see page 84.

The design factor of 4 to 1 on Alloy Chain agrees with the design factor used by the International Standards Organization (I.S.O.) and ANSI B30.9 is the preferred set of Working Load Limit values to be used.

To Make Your Grade 80 or Crosby® Spectrum 8® Alloy Chain Sling

Follow these simple steps in making a sling assembly:

Determine the maximum load to be lifted by the sling assembly.

Choose the type of sling assembly suited for the shape of the load and the size of the sling assembly for the load to be lifted. The decision must take into account the angle of the sling legs in multileg slings.

Determine the overall reach for bearing point of master link to bearing point on hook.

Select components, assemble chain and components. Affix sling identification tag to sling. The tag should be stamped with size chain, reach, type sling, Working Load Limit at a specific angle of lift, and some identifying number for record keeping.

If measurement comes in the link, cut the following link. For two leg type count the links and use an even number for clevis hooks and an odd number for eye hooks. This will position hooks in the same plane. In multileg slings always use the same number of links in each leg.

Caution

Derate chain in accordance with working load limit chart shown above.

A chain grab hook application will result in 20% reduction of chain capacity.

Care should be taken to observe these derated applications or chain may fracture or permanently stretch at loads less than the advertised chain ultimate strength and proof load respectively.

Grade 80 Alloy Chain Specifications

Chain Size (In.)	Nominal Inside Length Inches	Nominal Inside Width Inches	Weight Per 100-Ft. Lbs.	Working Load Limits Lbs.

Crosby® Chain Sling Configurations

"Proof Tested" Parts Needed to Make Self Assembled Slings

KEY TO SELECTING PROPER COMPONENTS

To locate proper size Crosby chain fittings for required chain size, use following steps:

1. Locate proper table (below) for type of sling being assembled (Single, Double, Triple or Quad leg).
2. Determine size of chain required from the Working Load Limit table on page 89.
3. Locate proper chain size in the "Spectrum 8 Chain Size" column in the proper table below.
4. Follow row across until desired style of fitting is found. The size shown indicates the proper size Crosby chain fitting to be used.

* Minimum Ultimate Load is 5 times Working Load Limit.

** Proof test load equals or exceeds the requirement of ASTM A957 (8.1) and ASME B30.9-1.4 for the chain size and number of legs shown on page 89.

† Based on single leg sling (in-line load), or resultant load on multiple legs with an included angle less than or equal to 120°. For use with chain slings, refer to page 89.

†† Welded Master Link.

See page 84 and 89 for additional chain information.

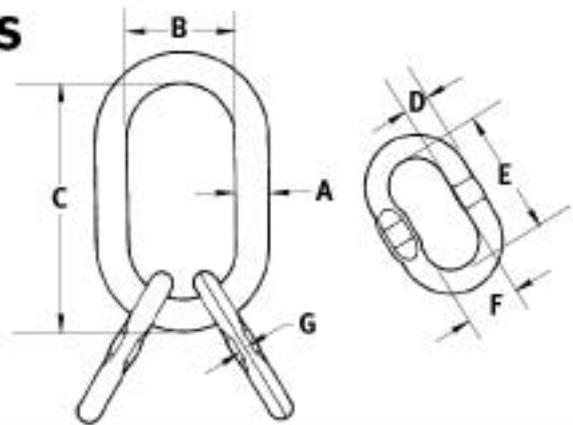

Crosby® Grade 8 Alloy Fittings

Master Link Assembly

- Alloy Steel – Quenched and Tempered.
- Individually proof tested at 2 times Working Load Limit with certification.
- Proof test certification shipped with each link.

† Ultimate Load is 4 times the Working Load Limit.

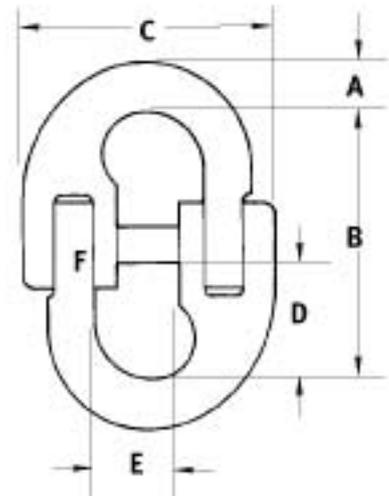

* Based on 60° included angle or smaller. For included angles greater than 60°, the Working Load Limit must be de-rated. For use with chain slings, refer to page 89.

Lok-A-Loy® 8 Alloy Connecting Link

- Individually Proof Tested at 2-1/2 times Working Load Limit with certification.
- Locking system that provides for simple assembly and disassembly – no special tools needed.
- Meets ASTM A-952-96 standards for Grade 8 chain fittings.
- Forged Alloy Steel – Quenched and Tempered.
- Fatigue rated.

Crosby® Chain Hooks

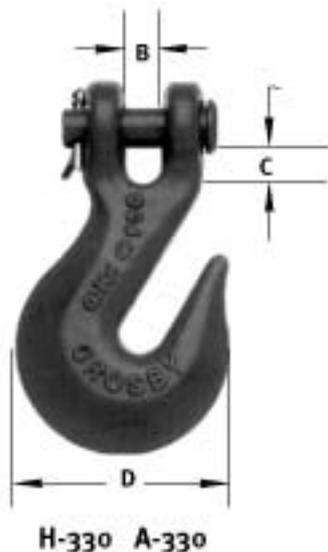

Clevis Grab Hooks

A-330 hooks now rated for use with Grade 8 Chain.*

- Forged Steel – Quenched and Tempered.
- Features quick and easy assembly.
- H-330 designed for Crosby Spectrum 4® chain.
- A-330 designed for Crosby Spectrum 7® chain.
- Design factor is 4:1.

Chain Size (In.)	Working Load Limit (Lbs.)		Weight Each (Lbs.)	Dimensions (in.)		
	H-330 Carbon	A-330 Alloy		B	C	D
1/4	2,600	3,500	.36	.32	.31	1.81

1/2	9,200	12,000	2.22	.75	.70	3.56
5/8	13,000	15,800	4.41	.91	.84	4.39
3/4	16,200	20,200	6.50	.94	.94	5.22

*Only A-330 hooks containing an "8" designating Grade 8, have new Working Load Limits.

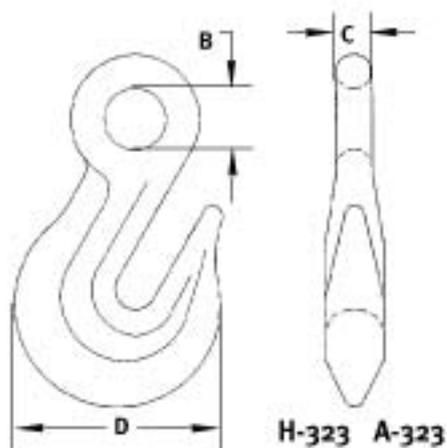

Eye Grab Hooks

- Forged Steel – Quenched and Tempered.
- Design factor is 4:1.
- H-323 designed for Crosby Spectrum 4® chain.
- A-323 designed for Crosby Spectrum 7® chain.

Chain Size (In.)	Working Load Limit (Lbs.)		Weight Each (Lbs.)	Dimensions (in.)		
	Carbon H-323	Alloy A-323		B	C	D
1/4	2,600	3,500	.28	.53	.31	1.81
5/16	3,900	5,400	.45	.62	.38	2.12
3/8	5,400	7,100	.79	.75	.44	2.53
1/2	9,200	12,000	1.75	.88	.53	3.56

*Note: Proof load is 2 times Working Load Limit. All carbon hooks — average straightening load (ultimate load) is 5 times Working Load Limit. Alloy eye hooks 1 ton through 25 ton — average straightening load (ultimate load) is 5 times Working Load Limit. Alloy eye hooks 30 tons through 60 tons — average straightening load (ultimate load) is 4.5 times Working Load Limit. All Alloy shank hooks — average straightening load (ultimate load) is 4.5 times the Working Load Limit. All Bronze hooks — average straightening load (ultimate load) is 4 times Working Load Limit.

Crosby® Swivel Hooks

Swivel Hoist Hooks

This hook is a positioning device and is not intended to rotate under load. For swivel hooks designed to rotate under load see page 104 thru 107. Use in salt water requires shank and nut inspection in accordance with A.S.M.E., B10-1.2.1.1-(b)-2(c) 1996.

- Forged - Quenched & Tempered
- Proper design, careful forging and precision controlled quenched and tempering gives maximum strength without excessive weight and bulk.
- Rated capacity is permanently shown on each hook - S-322 hooks have the same rating code as 319 shank hooks.
- Every Crosby Laughlin Swivel Hook has a pre-drilled cam which can be equipped with a latch.
- Even years after purchase of the original hook, latch assemblies can be added.

Crosby® Swivels

For swiveling under loads.

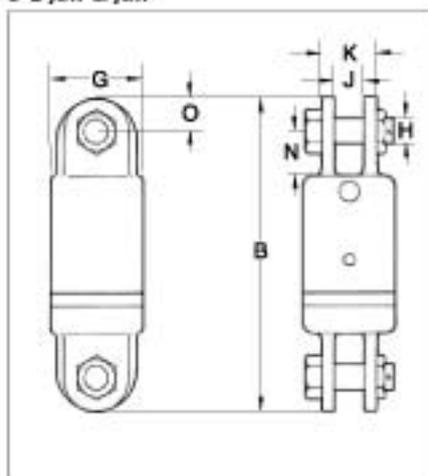

Equipped with Tapered Roller Thrust Bearing

- Designed to swivel under load.
- All swivels individually proof tested with certification.
- All hooks furnished with latches assembled.
- All jaws complete with bolts, nuts and cotter pins.
- Pressure lube fitting provided.
- NOT TO BE USED ON DEMOLITION (WRECKING) BALLS.
- Other types and capacities up to 600 tons, available to meet your requirements.

G-341 & S-341

Replacement Links

Pear Shape "Missing Link"® G-334

- Galvanized or Self-colored.
- Forged Steel – Quenched and Tempered.
- Has larger inside dimensions making it easier to attach hooks or other fittings to the chain.
- An exclusive Crosby product.
- After making connections, rivets must be peened.

Not suitable for use with Grade 8 chain or chain slings used in overhead lifting.

Crosby® Pad Eyes

- Forged Steel – Quenched and Tempered.
- Forged from 1035 Carbon Steel.
- Excellent welding qualities.
- Widely used on farm machinery, trucks, steel hulled marine vessels and material handling equipment.
- Reference American Welding Society specifications for proper welding procedures.

- Hot dip galvanized forged steel quenched and tempered.
- Outstanding design features include elongated turnbuckle eyes. Shackles one size smaller than turnbuckles can be reeved through turnbuckle eye.
- Jaw End Fitting, sizes 1/4" through 5/8" have Bolts and Nuts. Jaw End Fittings, sizes 3/4" through 2-3/4" have pins and cotters.
- Galvanized lock nuts available for all sizes.
- Hooks not supplied on sizes larger than 1-1/2".

Crosby® Forged Anchor Shackles

Load Rated

QUIC-CHECK®

QT

- Working Load Limit permanently shown on every shackle.
- Forged – Quenched and Tempered, with alloy pins.
- Capacities 1/3 thru 55 metric tons.
- Look for the Red Pin® ... the mark of genuine Crosby quality.
- Shackles can be furnished proof tested with certificates to designated standards, such as ABS, DNV, Lloyds, or other certification. Charges for proof testing and certification available when requested at the time of order.
- Hot Dip galvanized or Self Colored.
- Fatigue rated.

Screw Pin G-209 S-209

Screw pin anchor shackles meet the performance requirements of Federal Specification RR-C-271D Type IVA, Grade A, Class 2, except for those provisions required of the contractor.

Round Pin G-213 S-213

Round pin anchor shackles meet the performance requirements of Federal Specification RR-C-271D Type IVA, Grade A, Class 1, except for those provisions required of the contractor.

How to Order Wire Rope Products

To insure that your order is filled accurately, according to your requirements, the following information should be included for each item.

1. **LENGTH** The length of each piece and the number of pieces required should be specified
2. **DIAMETER** Specify the exact diameter of rope required.
3. **CONSTRUCTION** It is necessary to state the required construction of the rope.
4. **FINISH** When galvanized finish is required, it should be so stated. If no finish is stated, bright, or ungalvanized, finish will be furnished.
5. **GRADE** The grade of steel should be stated, i.e. Improved Plow Steel (IPS) or Extra-improved Plow Steel (XIP).
6. **PREFORMING** The requirement of preformed or non-preformed rope must be specified.
7. **LAY** The direction and type of lay should be specified. If no lay is specified, Right Regular Lay will be furnished.
8. **CORE** Specify which type core is desired.
9. **PURPOSE** It is desirable that you state the purpose or end use of the rope.
10. **SPECIAL PROCESSING** Any special instructions not included in the above should be stated exactly.

Wire Rope

Wire rope is a mechanical power-transmission machine-made of a number of multi-wired strands laid in a helix around a core of steel or fiber. Each member of this machine, that is the wires, has a precision tolerance to allow the rope to operate.

The wires, used to construct the strands, derive their physical properties from chosen metallurgy, cold-metal working and heat-treatment, and greatly influence the life span of the rope.

In the formation of strands, any number of variations of wires and sizes can be conceived. However, with years of experience in rope designing, certain number of wires and manner of forming them in strands have been standardized.

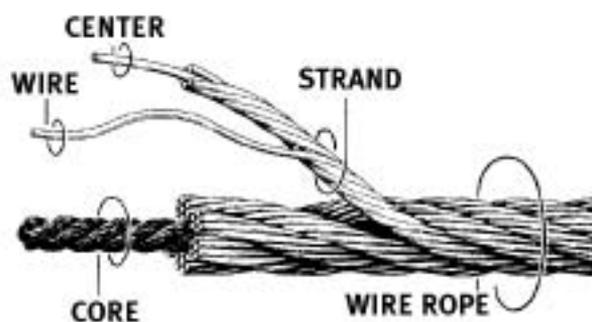

In rope formation, the strands are laid in a prefixed helix around a core -which provides the support to the strands. The strands could follow either a left- or right-hand spiral and the direction of wires in the strand could be the same as that of the strand (LANG LAY) or opposite (REGULAR LAY),

CORES

Most wire ropes are supplied either with a fiber or a steel core. The core is the foundation of a wire rope. Its primary function is to support the wire strands of the rope, maintaining them in their correct relative positions during the operating life of the rope.

Fiber cores are ropes made from fibers formed into yarns, then into strands and finally into the finished core form. There are two general types of fiber: natural vegetable material, such as sisal or cotton, and synthetic filaments, such as polypropylene.

Steel cores comprise an independent wire rope (IWRC) or, in the case of small diameter ropes, a wire strand core (WSC). These steel cores provide more substantial support than fiber cores to the outer strands during the rope's operating life. Steel cores resist crushing, are more resistant to heat, reduce the amount of stretch, and increase the strength of the rope.

WIRE ROPE LAY

The helix or spiral of the wires and strands in a rope is called the lay. Regular lay means the wires and strands spiral in opposite directions; thus the wires appear to run roughly parallel to the center line of the rope. Lang lay is the opposite; the wires and strands spiral in the same direction and seem to run at a diagonal to the center line of the rope. If the strands rotate around the rope in a clockwise direction (as the threads do in a right hand bolt), the rope is said to be right lay. When the strands rotate in a counterclockwise direction (as the threads do in a left hand bolt), the rope is left lay. Right regular lay is furnished for all rope applications unless otherwise specified.

When a lay-length is used as a unit of measure, it refers to the lengthwise distance a single strand extends in making one complete turn around the rope. Lay length is measured in a straight line parallel to the center line of the rope, not by following the path of the strand. The appropriate time to replace a wire rope in service is frequently determined by counting the number of broken wires in the length of one rope lay.

Right Lay—Regular Lay

Left Lay—Regular Lay

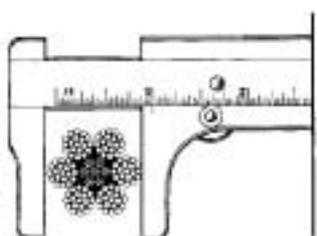

Right Lay—Lang Lay

Wire Rope

HOW TO CALIPER WIRE ROPE

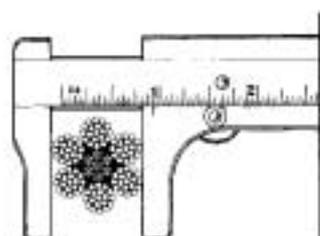

Rope diameter is specified by the user and is generally given in the equipment manufacturer's instruction manual accompanying the machine on which the rope is to be used.

Rope diameters are determined by measuring the circle that just touches the extreme outer limits of the strands—that is, the greatest dimension that can be measured with a pair of parallel-jawed calipers or machinist's caliper square. A mistake could be made by measuring the smaller dimension.

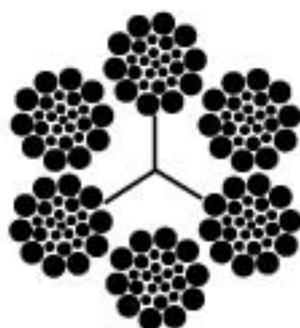

RIGHT WAY

Always measure the *larger* dimension, between the outer limits of the strands.

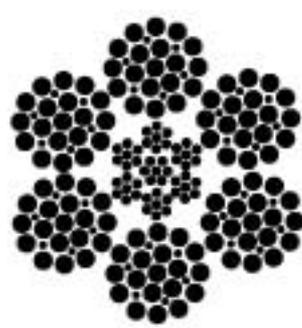

WRONG WAY

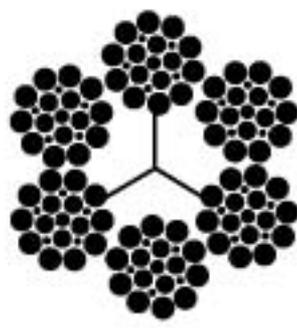

Do not measure the *smaller* dimension across the "flats" of the strands.

6 x 21 Seale
with fiber core

SPECIFICATIONS

Wire rope is manufactured to Federal Specification RR-W-410, and to meet the requirements of American Bureau of Shipping, Lloyd's Registry, American Petroleum Institute, and others that may be applicable.

Some special-purpose ropes are covered by other specifications. Mining ropes follow the recommended specifications of the U.S. Bureau of Mines. Elevator ropes, to meet conditions peculiar to the operation of passenger and freight elevators, are generally made to other, more restrictive specifications.

Specifications serve a useful purpose in establishing manufacturing limitations. However, they do not specify how good a wire rope may be. They indicate the permissible minimum.

WIRE ROPE TOLERANCE

Wire rope is always made larger – never smaller – than the nominal diameter. In standard practice, the nominal diameter is the minimum diameter. All tolerances are taken on the plus side. A rope is not termed oversize until its diameter exceeds the allowable maximum.

Example: a 1-in. nominal-diameter wire rope may vary between 1 in. and 1-3/64 in. in diameter.

Wire Rope Common Terms

AIRCRAFT CABLES – Strands and wire ropes made of special strength wire originally used primarily for aircraft controls and miscellaneous uses of aircraft industry. No longer made to that specification.

CLOSED SOCKET – Wire rope and fitting consisting of basket and bail made integral

CONSTRUCTION – Design of wire rope including number of strands, number of wires per strand and arrangement of wires in each strand

CORE – Member of a wire rope about which the strands are laid. It may be fiber, a wire strand or an independent wire rope

CORRUGATED – Term used to describe the grooves of a sheave or drum when worn so as to show the impression of a wire rope

DIAMETER – Distance measured across the center of a circle circumscribing the wires of a strand or the strands of a wire rope

GALVANIZED ROPE – Rope made of galvanized wire

GRADES, ROPE – Classification of wire rope by its breaking strength. In order of increasing breaking strengths they are Iron, Traction, Mild Plow Steel, Plow Steel, Improved Plow Steel, Extra Improved Plow Steel

GRADES, STRAND – Classification of strand by its breaking strength. In order of increasing breaking strengths they are Common, Siemens Martin, High Strength and Extra-high Strength. A Utilities grade strand is also made to meet special requirement

INNER WIRES – All wires of a strand except surface or cover wires

INTERNALLY LUBRICATED – Wire rope or strand having all wires coated with lubricant

IWRC – “Independent Wire Rope Core”

LANG LAY ROPE – Wire rope in which the wires in the strands in the rope are laid in the same direction

LAY – Manner in which wires are helically laid into strands or strands into rope

LEFT LAY – (a) Strand – Strand in which the cover wires are laid in a helix having a left-hand pitch; (b) Rope – Rope in which the strands are laid in a helix having a left-hand pitch

MOORING LINES – Galvanized wire rope, usually 6 x 12, 6 x 24 or spring lay construction, for holding ships to dock

OPEN SOCKET – Wire rope fitting consisting of a “basket” and two “ears” with a pin

SUPER-FLEX SLINGS

Several wire ropes helically laid by machine form sling body of 3, 4, 5, 7 or 9 parts. Offer higher rated capacity than hand formed slings. Flemish-type splices and mechanically pressed sleeves form eyes, providing “centerline” pull. High flexibility. Every sling proof tested.

BRAIDED SLINGS

One or more wire ropes are braided to provide wide bearing surface in the body. Very flexible and capable of bending in tight radius to “snug up tight” around loads. 5, 6 and 7-part slings have flat bodies, 8-part is round.

PREFORMED WIRE ROPE – Wire rope in which the strands are permanently shaped, before fabrication into the rope to the helical form they assume in the wire rope

REEL – The flanged spool on which wire rope or strand is wound for storage or shipment

REGULAR LAY ROPE – Wire rope in which the wires in the strands and the strands in the rope are laid in opposite directions

REVERSE LAY – Synonymous with “Alternate Lay”

ROTARY LINES – The wire rope on a rotary drilling rig which raises and lowers the traveling block

SOCKET – Type of wire rope fitting. See “Closed Sockets,” “Open Sockets” and “Wedge Sockets”

STAINLESS STEEL ROPE – Wire rope made of chrome-nickel steel wires having great resistance to corrosion

STRENGTH, NOMINAL – Published catalog strength which has been calculated and accepted by the wire rope industry following a set standard procedure. The wire rope manufacturer uses this strength as a minimum strength when designing the wire rope, and the user should consider this to be the strength when making his design calculations

STRENGTH, ACCEPTANCE – Strength which is 2-1/2% lower than the nominal strength. This variance is used to offset possible variables which might exist when the test is made to determine the breaking strength of a specific piece of wire rope. Its use originated with the basic government wire rope specification

STRENGTH, BREAKING – Load, applied through some type of tensile machine, that it takes to pull that piece of rope apart. This is the load at which a tensile failure occurs in the piece of wire rope being tested

STRENGTH, AGGREGATE – Sum of the breaking strength in tension of all the wires of a wire rope when the wires are tested individually

THIMBLE – Grooved metal fitting to protect the eye of a wire rope

WEDGE SOCKET – Wire rope fitting in which the rope is secured by a wedge

WIRE ROPE – A plurality of strands laid helically around an axis or a core

HAND LAID & SPLICED SLINGS

Fabricated from one or more wire ropes helically laid together continuously through both eyes and sling body. Rope ends secured by hand-tucked splices. High flexibility, conform well to irregular loads, snug load tighter in choke hitch and easier to pull from under loads than mechanically spliced eyes.

CABLE LAID SLINGS

These smooth, clean slings are made from a rope-like fabric formed by laying 6 wire ropes in a helical pattern around a core rope. Flemish splices secured by pressed sleeves provide “centerline” pull at eyes. More flexible than same capacity single-part slings.

*1/2	12.7	45.8	20,600	22,800

Note: 1/16 through 3/8 also available in 7 x 7
*6 x 19 IWRC

Used in a variety of applications, these small ropes are fabricated to uniform size and quality. For example, 1/16" 7x19 contains 133 separate wires, making the wires approximately the diameter of a human hair—but still provides strength, bendability, and fatigue resistance.

These cables have been historically called "Aircraft" cable—but since most applications do not require the special marking, lubrication and testing, a utility cable is provided.

Spring-Lay

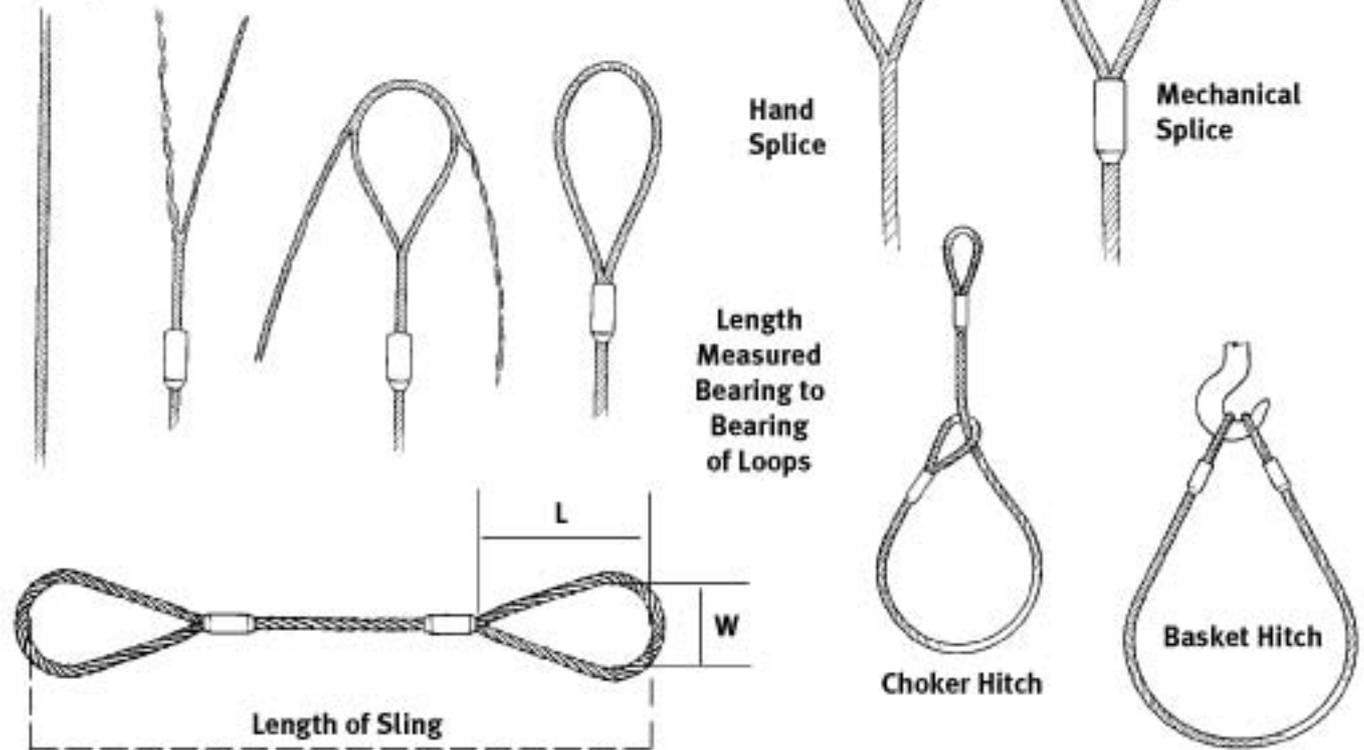

Diameter Inches	Galvanized Fiber Core	
	Approx. Weight Per Foot Pounds	Minimum Breaking Strength Tons Of 2,000 Lb.
1/2	.22	4.47
9/16	.28	5.64
5/8	.34	6.95
3/4	.49	9.96
7/8	.63	13.5
1	.88	17.5
1-1/8	1.14	22.1
1-1/4	1.36	27.2
1-3/8	1.66	32.8
1-1/2	1.97	38.9
1-5/8	2.28	45.6
1-3/4	2.67	52.7
1-7/8	3.09	60.3
2	3.53	68.5
2-1/4	4.56	86.3
2-1/2	5.44	106.
2-3/4	6.65	127.

Spring-Lay is used for marine towing and mooring lines. High in strength—for strength equal to manila rope it only needs to be one-half the diameter, and its weight is less than manila rope of equal strength.

Single Leg Wire Rope Slings

In the flemish eye mechanical splice, rope is separated into two parts - 3 adjacent strands, and 3 adjacent strands and core. These are then re-laid back in opposite directions to form an eye, and secured with a pressed metal sleeve.

2	16	32	9' 10"	32.0	24.0	64.0	55.0	45.0	32.0

*Rated loads are based on a diameter of curvature of 20 times the individual rope diameter at points of sling contact with load.

Two Legged Bridle

Rated Capacity for two-legged bridles whether used as chokers or with hooks or other end fixtures, is affected by rigging angles, the same as straight slings in basket hitches. Note reduction in rated capacity as legs spread to wider angles.

6 x 19, 6 x 37 Type, I.P., IWRC

Three Legged Bridle

Single Part Body Slings

Multi-legged bridles – with two, three or four straight legs – are offered with plain eyes, thimble eyes, open or closed sockets, shackles and turnbuckles. If required, rings or alloy oblong links can be supplied rather than the pear shaped links shown.

Rated capacities for 3 and 4 bridle slings are based on equal leg slings with the sling angle being the greatest angle measured between any two of the sling legs.

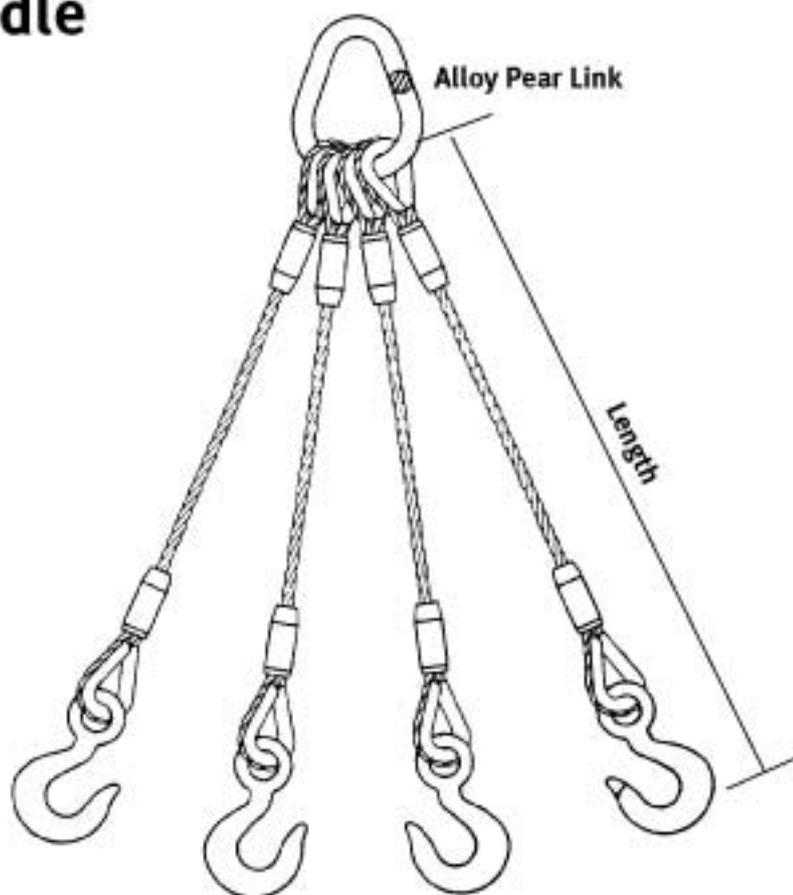

6 x 19, 6 x 37 Type, I.P., IWRC

WARNINGS AND APPLICATION INSTRUCTIONS

G-450
(Red-U-Bolt)

SS-450
(316
Stainless
Steel)

WARNING

- Failure to read, understand, and follow these instructions may cause death or serious injury.
- Read and understand these instructions before using clips.
- Match the same size clip to the same size wire rope.
- Prepare wire rope end termination only as instructed.
- Do not use with plastic coated wire rope.
- Apply first load to test the assembly. This load should be of equal or greater weight than loads expected in use. Next, check and retighten nuts to recommended torque. (See Table 1, this page).

Efficiency ratings for wire rope end terminations are based upon the catalog breaking strength of wire rope. The efficiency rating of a properly prepared loop or thimble - eye termination for clip sizes 1/8" through 7/8" is 80%, and for sizes 1" through 3-1/2" is 90%.

The number of clips shown (see Table 1) is based upon using RRL or RLL wire rope, 6 x 19 or 6 x 37 Class, FC or IWRC; IPS or XIP. If Seale construction or similar large outer wire type construction in the 6 x 19 Class is to be used for sizes 1 inch and larger, add one additional clip. If a pulley (sheave) is used for turning back the wire rope, add one additional clip.

The number of clips shown also applies to rotation - resistant RRL wire rope, 8 x 19 Class, IPS, XIP, sizes 1-1/2 inch and smaller; and to rotation - resistant RRL wire rope, 19 x 7 Class, IPS, XIP, sizes 1-3/4 inch and smaller.

For other classes of wire rope not mentioned above, we recommend contacting Washinton Chain or Crosby.

For elevator, personnel hoist, and scaffold applications, refer to ANSI A17.1 and ANSI A10.4. These standards do not recommend U-Bolt style wire rope clip terminations. The style wire rope termination used for any application is the obligation of the user.

For OSHA (Construction) applications, see OSHA 1926.251.

1. Refer to Table 1 in following these instructions. Turn back specified amount of rope from thimble or loop. Apply first clip one base width from dead end of rope. Apply U-Bolt over dead end of wire rope - live end rests in saddle (Never saddle a dead horse!). Tighten nuts evenly, alternate from one nut to the other until reaching the recommended torque.

2. When two clips are required, apply the second clip as near the loop or thimble as possible. Tighten nuts evenly, alternating until reaching the recommended torque. When more than two clips are required, apply the second clip as near the loop or thimble as possible, turn nuts on second clip firmly, but do not tighten. Proceed to Step 3.

3. When three or more clips are required, space additional clips equally between first two - take up rope slack - tighten nuts on each U-Bolt evenly, alternating from one nut to the other until reaching recommended torque.

4. WIRE ROPE SPLICING PROCEDURES:

The preferred method of splicing two wire ropes together is to use interlocking turnback eyes with thimbles, using the recommended number of clips on each eye (See Figure 1).

Figure 1

An alternate method is to use twice the number of clips as used for a turnback termination. The rope ends are placed parallel to each other, overlapping by twice the turnback amount shown

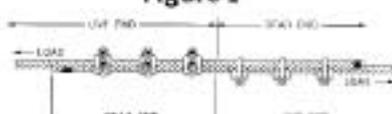

Figure 2

in the application instructions. The minimum number of clips should be installed on each dead end (See Figure 2). Spacing, installation torque, and other instructions still apply.

5. **IMPORTANT** Apply first load to test the assembly. This load should be of equal or greater weight than loads expected in use. Next, check and retighten nuts to recommended torque.

In accordance with good rigging and maintenance practices, the wire rope end termination should be inspected periodically for wear, abuse, and general adequacy.

Table 1

Clip Size (Inches)	Rope Size (Inches)	Minimum No. of Clips	Amount of Rope to Turn Back in Inches	*Torque in Ft. Lbs.
1/8	1/8	2	3-1/4	4.5
3/16	3/16	2	3-3/4	7.5
1/4	1/4	2	4-3/4	15
5/16	5/16	2	5-1/4	30
3/8	3/8	2	6-1/2	45
7/16	7/16	2	7	65
1/2	1/2	3	11-1/2	65
9/16	9/16	3	12	95
5/8	5/8	3	12	95
3/4	3/4	4	18	130
7/8	7/8	4	19	225
1	1	5	26	225
1-1/8	1-1/8	6	34	225
1-1/4	1-1/4	7	44	360
1-3/8	1-3/8	7	44	360
1-1/2	1-1/2	8	54	360
1-5/8	1-5/8	8	58	430
1-3/4	1-3/4	8	61	590
2	2	8	71	750
2-1/4	2-1/4	8	73	750
2-1/2	2-1/2	9	84	750
2-3/4	2-3/4	10	100	750
3	3	10	106	1200
3-1/2	3-1/2	12	149	1200

If a pulley (sheave) is used for turning back the wire rope, add one additional clip.

If a greater number of clips are used than shown in the table, the amount of turnback should be increased proportionately.

*The tightening torque values shown are based upon the threads being clean, dry, and free of lubrication.

Crosby® The SS-450 “316” Stainless Steel Wire Rope Clips

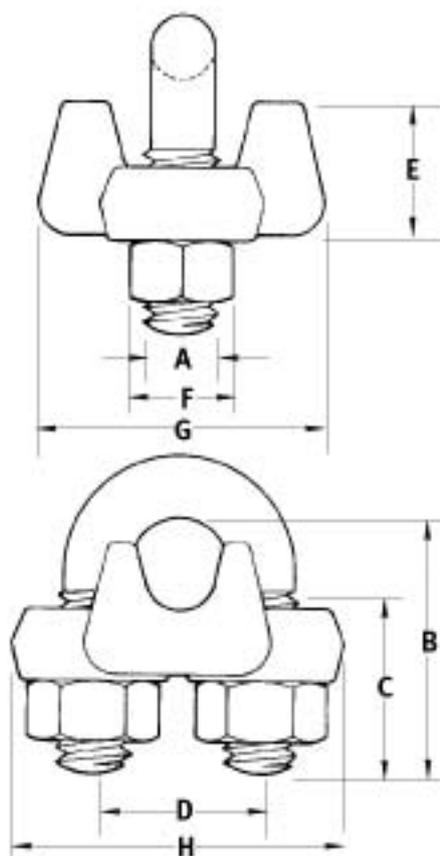

**SEE APPLICATION AND
WARNING INFORMATION
On Page 140**

- Each base has a Product Identification Code (PIC) for material traceability, the name CROSBY or “CG”, and a size forged into it.
- Entire clip is made from 316 Stainless Steel to resist corrosive and rusting action.
- All components are Electro-Polished.
- All Clips are individually bagged or tagged with proper application instructions and warning information.

SS-450

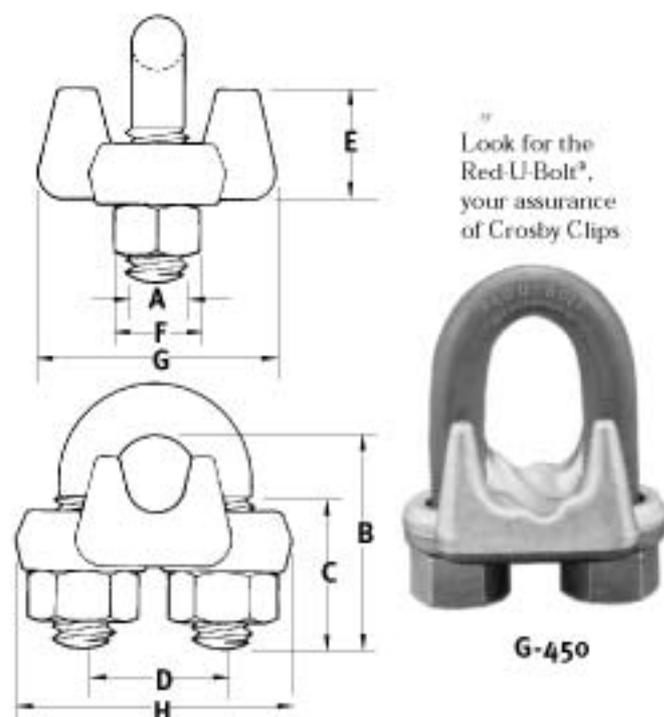

Rope Size	Weight Per 100 (Lbs.)	Dimensions (In.)							
		A	B	C	D	E	F	G	H
1/8	6	.22	.72	.44	.47	.41	.38	.81	.94

Forged Wire Rope Clips

- Each base has a Product Identification Code (PIC) for material traceability, the name CROSBY or "CG", and a size forged into it.
- Sizes 1/8" through 2-1/2" have forged bases.
- Entire Clip – Galvanized to resist corrosive and rusting action.
- Only Genuine Crosby Clips have a Red U-BOLT for instant recognition.
- All Clips are individually bagged or tagged with proper application instructions and warning information.
- Clip sizes up through 1-1/2" have rolled threads.

Crosby Clips, all sizes 1/4" and larger, meet performance requirements of Federal Specification FF-C-450 TYPE 1 CLASS 1, except for those provisions required of the contractor.

Crosby® Clips

Crosby® Fist Grip Clips

WARNINGS AND APPLICATION INSTRUCTIONS

G-429

WARNING

- Failure to read, understand, and follow these instructions may cause death or serious injury.
- Read and understand these instructions before using clips.
- Match the same size clip to the same size wire rope.
- Prepare wire rope end termination only as instructed.
- Do not use with plastic coated wire rope.
- Apply first load to test the assembly. This load should be of equal or greater weight than loads expected in use. Next, check and retighten nuts to recommended torque. (See Table 1, this page).

Efficiency ratings for wire rope end terminations are based upon the catalog breaking strength of wire rope. The efficiency rating of a properly prepared loop or thimble - eye termination for clip sizes 1/8" through 7/8" is 80%, and for sizes 1" through 3-1/2" is 90%.

The number of clips shown (see Table 1) is based upon using RRL or RLL wire rope, 6 x 19 or 6 x 37 Class, FC or IWRC; IPS or XIP. If Seale construction or similar large outer wire type construction in the 6 x 19 Class is to be used for sizes 1 inch and larger, add one additional clip. If a pulley (sheave) is used for turning back the wire rope, add one additional clip.

The number of clips shown also applies to rotation - resistant RRL wire rope, 8 x 19 Class, IPS, XIP, sizes 1-1/2 inch and smaller; and to rotation-resistant RRL wire rope, 19 x 7 Class, IPS, XIP, sizes 1-1/2 inch and smaller.

For other classes of wire rope not mentioned above, please contact Washington Chain.

The style wire rope termination used for any application is the obligation of the user.

For OSHA (Construction) applications, see OSHA 1926.251.

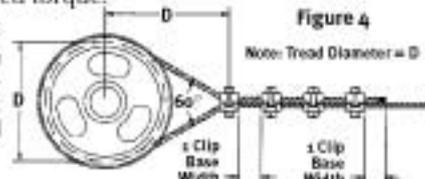

1. Refer to Table 1 in following these instructions. Turn back specified amount of rope from thimble or loop. Apply first clip one base width from dead end of rope. Tighten nuts evenly, alternating from one nut to the other until reaching the recommended torque.

2. When two clips are required, apply the second clip as near the loop or thimble as possible. Tighten nuts evenly, alternating until reaching the recommended torque. When more than two clips are required, apply the second clip as near the loop or thimble as possible, turn nuts on second clip firmly, but do not tighten. Proceed to Step 3.

3. When three or more clips are required, space additional clips equally between first two - take up rope slack - tighten nuts on each clip evenly, alternating from one nut to the other until reaching recommended torque.

5. WIRE ROPE SPLICING PROCEDURES:

The preferred method of splicing two wire ropes together is to use interlocking turnback eyes with thimbles, using the recommended number of clips on each eye (See Figure 5).

An alternate method is to use twice the number of clips as used for a turnback termination. The rope ends are placed parallel to each other, overlapping by twice the turnback amount shown in the application instructions.

Figure 5

The minimum number of clips should be installed on each dead end (See Figure 6). Spacing, installation torque, and other instructions still apply.

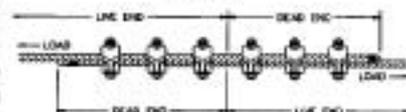

Figure 6

6. **IMPORTANT** Apply first load to test the assembly. This load should be of equal or greater weight than loads expected in use. Next, check and retighten nuts to recommended torque.

In accordance with good rigging and maintenance practices, the wire rope end termination should be inspected periodically for wear, abuse, and general adequacy.

Table 1

Clip Size (Inches)	Rope Size (Inches)	Minimum No. of Clips	Amount of Rope to Turn Back in Inches	*Torque in Ft. Lbs.
3/16	3/16	2	4	30
1/4	1/4	2	4	30
5/16	5/16	2	5	30
3/8	3/8	2	5-1/4	45
7/16	7/16	2	6-1/2	65
1/2	1/2	3	11	65
9/16	9/16	3	12-3/4	130
5/8	5/8	3	13-1/2	130
3/4	3/4	3	16	225
7/8	7/8	4	26	225
1	1	5	37	225
1-1/8	1-1/8	5	41	360
1-1/4	1-1/4	6	55	360
1-3/8	1-3/8	6	62	500
1-1/2	1-1/2	7	78	500

If a pulley (sheave) is used for turning back the wire rope, add one additional clip. See Figure 4.

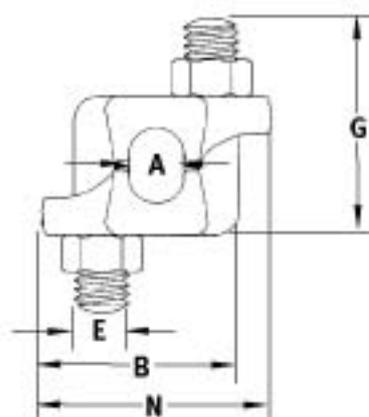

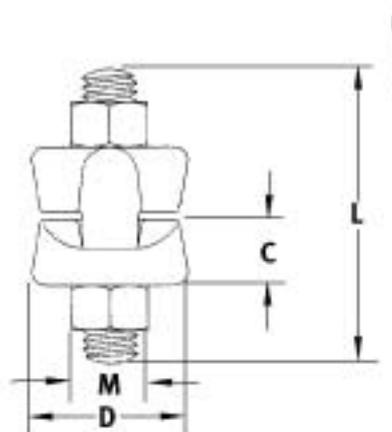

If a greater number of clips are used than shown in the table, the amount of turnback should be increased proportionately.

*The tightening torque values shown are based upon the threads being clean, dry, and free of lubrication.

Fist Grip® Clips

G-429

- Bolts are an integral part of the saddle. Nuts can be installed in such a way as to enable the operator to swing the wrench in a full arc for fast installation.
- All sizes have forged steel saddles.
- Entire clip is Galvanized to resist corrosive and rusting action.
- All Clips are individually bagged or tagged with proper application instructions and warning information.
- Assembled with standard heavy hex nuts.

Fist Grip wire clips meet or exceed the performance requirements of Federal Specification FF-C-450 Type III, Class 1, except for those provisions required of the contractor.

Crosby® Wedge Socket

WARNINGS AND APPLICATION INSTRUCTIONS

S-421

US-422

Important Safety Information - Read and Follow

Inspection/Maintenance Safety

- Always inspect socket, wedge and pin before using.
- Do not use part showing cracks.
- Do not use modified or substitute parts.
- Repair minor nicks or gouges to socket or pin by lightly grinding until surfaces are smooth. Do not reduce original dimension more than 10%. Do not repair by welding.
- Inspect permanent assemblies annually, or more often in severe operating conditions.
- Do not mix and match wedges or pins between models or sizes.
- Always select the proper wedge and socket for the wire rope size - see catalog for additional information.

Assembly Safety

- Use only with standard 6 to 8 strand wire rope of designated size. For intermediate size rope, use next larger size socket. For example: When using 9/16" diameter wire rope use a 5/8" size Wedge Socket Assembly. Welding of the tail on standard wire rope is not recommended. The tail length of the dead end should be a minimum of 6 rope diameters but not less than 6".
- Align live end of rope, with center line of pin. (See Figure 1)
- Secure dead end section of rope. (See Figure 1)
- DO NOT ATTACH DEAD END TO LIVE END. (See Figure 2)
- Use a hammer to seat Wedge and Rope as deep into socket as possible before applying first load.
- To use with Rotation Resistant wire rope (special wire rope constructions with 8 or more outer strands) ensure that the dead end is welded, brazed or seized before inserting the wire rope into the wedge socket to prevent core slippage or loss of rope lay. The tail length of the dead end should be a minimum of 20 rope diameters but not less than 6" (See Figure 1).

! WARNING

- Loads may slip or fall if the Wedge Socket is not properly installed.
- A falling load can seriously injure or kill.
- Read and understand these instructions before installing the Wedge Socket.
- Do not interchange Crosby wedge socket, wedge or pin with non Crosby wedge socket, wedge or pin.
- Apply first load to fully seat the Wedge and Wire Rope in the socket. This load should be of equal or greater weight than loads expected in use.
- Do not interchange wedges between S-421T and US-422 or between sizes.

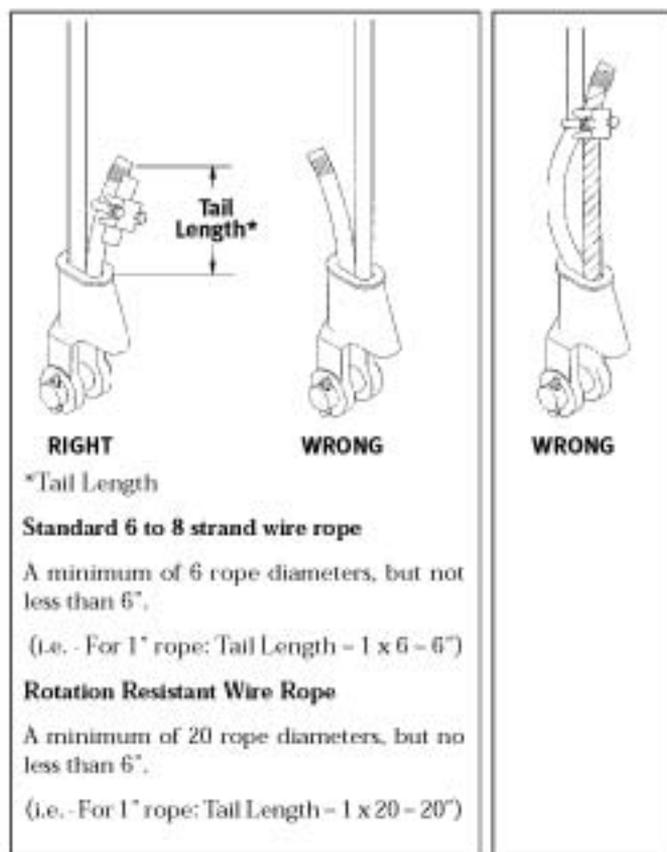

Figure 1

Figure 2

Operating Safety

- Apply first load to fully seat the Wedge and Wire Rope in the socket. This load should be of equal or greater weight than loads expected in use.
- Efficiency rating of the Wedge Socket termination is based upon the catalog breaking strength of Wire Rope. The efficiency of a properly assembled Wedge Socket is 80%.
- During use, do not strike the dead end section with any other elements of the rigging (Called two blocking).

Wedge Sockets

THE TERMINATOR™

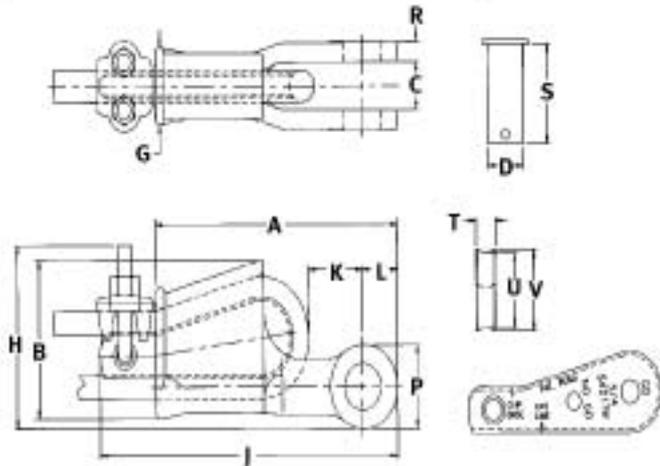

Crosby®'s "New & Improved" Wedge Socket

SEE APPLICATION AND WARNING INFORMATION ON PAGE 146

S-421T

Wire Rope Size (In.)	S-421T Complete Assembly Weight Each (Lbs.)††	S-421TW Wedge Only Weight Each (Lbs.)
3/8	3.18	.50
1/2	6.15	1.05

1-1/8	45.30	7.84
**1-1/4	57.50	6.81

*Terminator Assembly includes Socket, Wedge, Pin, and Wire Rope Clip.

**1-1/4" not available in TERMINATOR™ style.

Wedge Socket meets the performance requirements of Federal Specification RR S-550D Type C, except those provisions required of the contractor.

U.S. patent 5,553,360 and foreign equivalents.

- Individually magnetic particle inspected.
- Pin diameter and jaw opening allows wedge and socket to be used in conjunction with open swage and spelter sockets.
- Secures the tail or "dead end" of the wire rope to the wedge, thus eliminates loss or "Punch out" of the wedge.
- Eliminates the need for an extra piece of rope, and is easily installed.
- The TERMINATOR™ wedge eliminates the potential breaking off of the tail due to fatigue.
- The tail, which is secured by the base of the clip and the wedge, is left undeformed and available for reuse.
- Incorporates Crosby's patented QUIC-CHECK® "Go" and "No-Go" feature cast into the wedge. The proper size rope is determined when the following criteria are met:
 1. The wire rope should pass thru the "Go" hole in the wedge.
 2. The wire rope should NOT pass thru the "No-Go" hole in the wedge.
- Utilizes standard Crosby Red-U-Bolt wire rope clip
- Generates a minimum efficiency of 80% based on the catalog breaking strength of the wire rope.
- Standard S-421 wedge socket can be retrofitted with the new style TERMINATOR™ wedge.
- Available with Bolt, Nut, and Cotter Pin.

Crosby® Open Swage Sockets

S-501 Open Socket Specifications

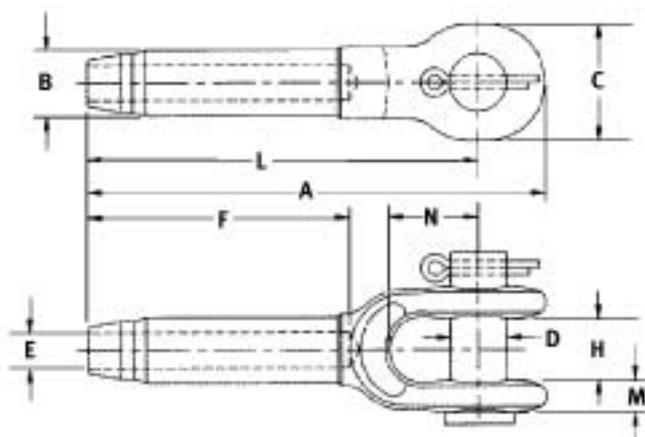

Forged from quality carbon steel, suitable for cold forming.

Hardness controlled by spheroidize annealing.

S-502 Swage Sockets are recommended for use with 6 x 19 or 6 x 37, IPS or XIP (EIP), XXIP (EEIP), RRL or IWRC wire rope.

Swage Socket terminations have an efficiency rating of 100% based on the catalog strength of wire rope.

Swage sockets incorporate a reduced machined area of the shank which is equivalent to the proper after swage dimension. Before swaging, this provides for an obvious visual difference in the shank diameter. After swaging, a uniform shank diameter is created allowing for a QUIC CHECK® and permanent visual inspection opportunity. This does not eliminate the need to perform standard production inspections which include gauging for the proper after swage dimensions or proof loading.

In accordance with ANSI B30.9, all slings terminated with swage sockets shall be proof loaded.*

Rope Size (In.)	Weight Each (Lbs.)	Before Swage Dimensions										Max. After Swage Dim. (In.)

*Maximum Proof Load shall not exceed 40% of XXIP rope catalog breaking strength.

Crosby® Closed Swage Sockets

S-502 Closed Socket Specifications

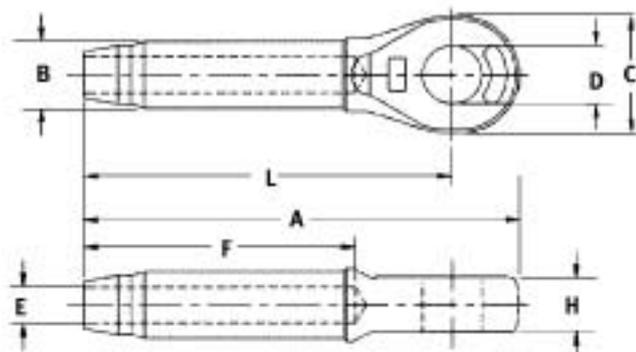

Forged from quality carbon steel, suitable for cold forming.

Hardness controlled by spheroidize annealing.

S-501 Swage Sockets are recommended for use with 6 x 19 or 6 x 37, IPS or XIP (EIP), XXIP (EEIP), RRL or IWRC wire rope.

Swage Socket terminations have an efficiency rating of 100% based on the catalog strength of wire rope.

Swage sockets incorporate a reduced machined area of the shank which is equivalent to the proper after Swage dimension. Before swaging, this provides for an obvious visual difference in the shank diameter. After swaging, a uniform shank diameter is created allowing for a QUIC CHECK® and permanent visual inspection opportunity. This does not eliminate the need to perform standard production inspections which include gauging for the proper after swage dimensions or proof loading.

In accordance with ANSI B30.9, all slings terminated with swage sockets shall be proof loaded.*

Crosby® Grooved Open Spelter Sockets

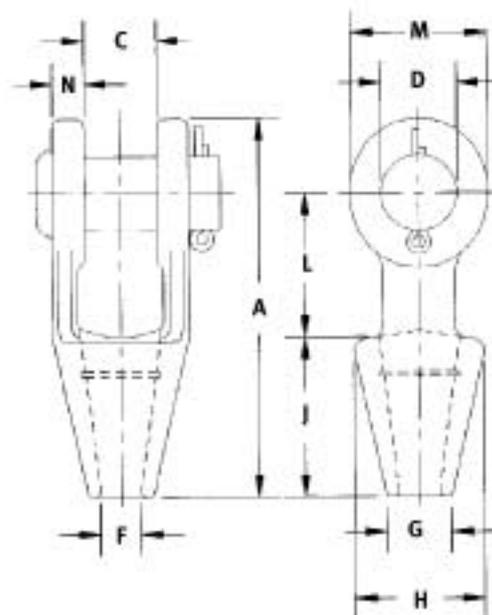

G-416

- Forged Steel Sockets thru 1-1/2", cast alloy steel 1-5/8" thru 4".
- Spelter socket terminations have an efficiency rating of 100%, based on the catalog strength of wire rope. Ratings are based on recommended use with 6 x 7, 6 x 19 or 6 x 37, IPS or XIP (EIP), XXIP (EEIP), RRL, FC, or IWRC wire rope.

Note: The drawing illustrates one groove used on sockets 1/4" thru 3/4". Sizes 7/8" thru 1-1/2" use two grooves. Sizes 1-5/8" and larger use three grooves.

Open Grooved Sockets meet the performance requirements of Federal Specification RRS-550D, Type A, except for those provisions required of the contractor.

Notice: All cast steel sockets 1-5/8" and larger are magnetic particle inspected and ultrasonic inspected. Proof testing available on special order.

† Cast Alloy Steel

Towing Socket

MARQUIP®

(Marine Equipment)

Cast Alloy Steel Round-To-Round Special Towing Socket

- 40% more material in critical stress and wear areas.
- Smooth round-to-round fit; eliminates excessive wear at points of contact.

Another Sure Link in Marquip's Marine Line

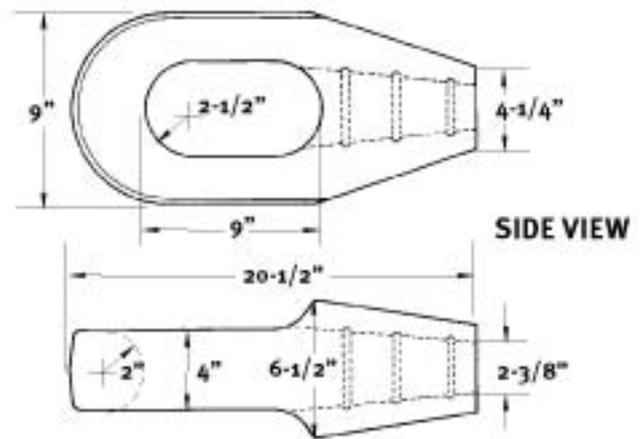

MARQUIP round-to-round special towing sockets are designed to eliminate excessive wear at contact points. They provide superior safety and longer service under heavy tows using 2" to 2-1/8" cable. They can also be modified to accept 2-1/4" extra-improved plow steel wire rope, with no reduction in reliability.

Made from 4140 extra-high-strength alloy steel, MARQUIP towing sockets are heat-treated, magnetic particle inspected, and pull-test rated to exceed the breaking strength of E.I.P. wire.

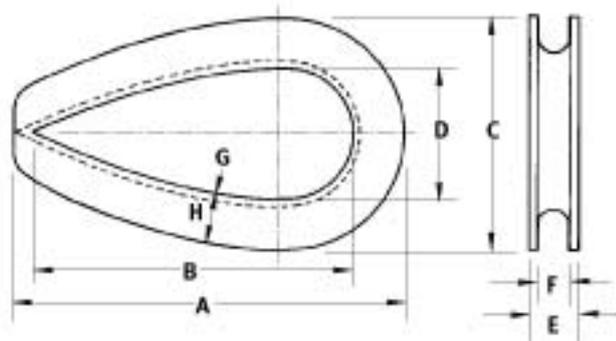

Not pictured is our Marquip Heavy Duty Tow Socket which features a radiused bale, Wt. 135 pounds.

Special Towing Socket Specifications	
Material:	Cast 4140 alloy steel, heat treated
Size:	Accepts 2", 2-1/8", and 2-1/4" wire rope
Dimensions:	20-1/2" x 9" x 6-1/2"
Weight:	113 pounds
Capacity:	Exceeds E.I.P wire capacity

Crosby® Extra Heavy Wire Rope Thimbles

G-414 and SS-414

- Greater protection against wear and deformation of the wire rope eye.
- Longer service life.
- Available in Hot Dip galvanized or Stainless Steel.
- Stainless steel recommended for more corrosive environments where greater protection is required.

G-414 meets the performance requirements of Federal Specification FF-T-276b Type III, except for those provisions required of the contractor.

Carpenter Stoppers

MARQUIP® (Marine Equipment)

Rugged, compact design cable grip for cable sizes from 1/2" to 3".

Hinged body has fixed smooth groove on one side; movable wedge, grooved with lay of cable, on the facing side. Movable wedge enables cable to be drawn tight.

Individually proof tested to twice the working load limit of XIP wire rope.

Cable can be released while under full tension by releasing latch on hinged lid. Lid is securely latched and locked with pin while in use.

Shackle holes are provided for rigging bridle to stopper. Bridles available with stoppers if desired.

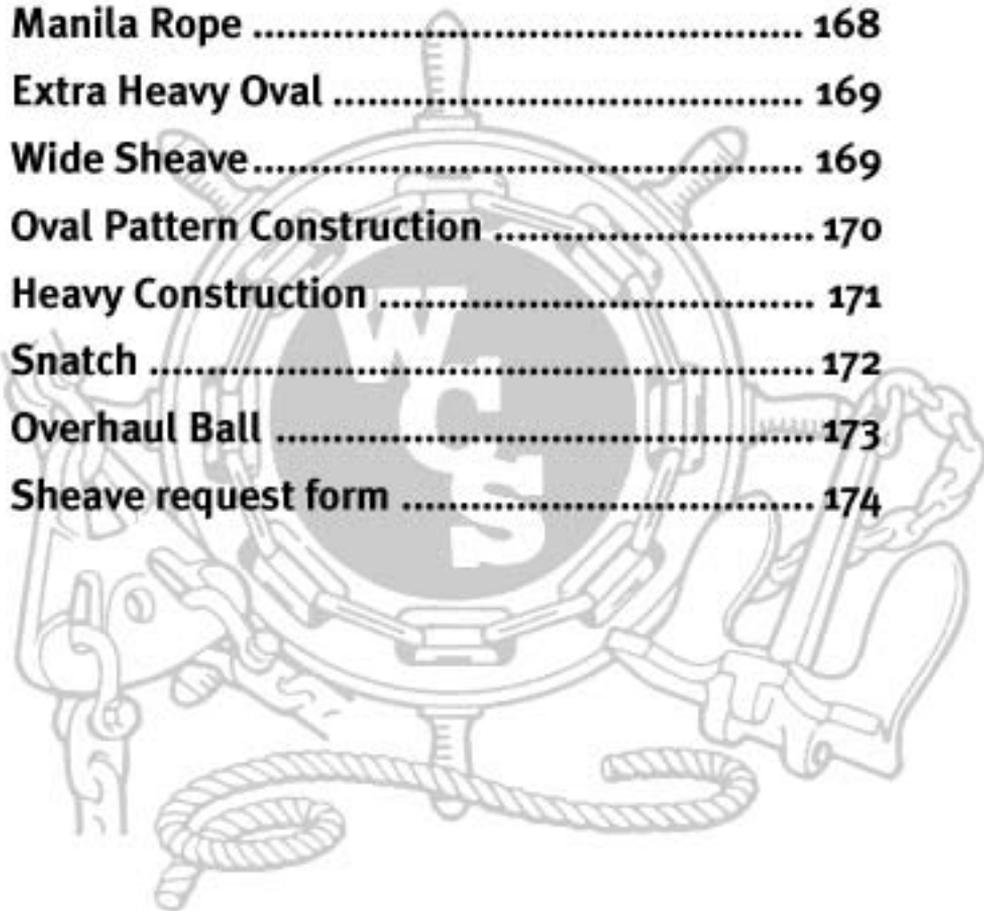

Note: Each size wire takes a separate stopper.

Wire Size	Length	Width	Hole Size	Thickness	Weight
1/2	6-3/4	5	11/16	3-1/4	11
5/8	6-3/4	5	11/16	3-1/4	11

Tackle Block Warning, Use and Maintenance Information

WARNING

- A potential hazard exists when lifting or dragging heavy loads with tackle block assemblies.
- Failure to design and use tackle block systems properly may cause a load to slip or fall - the result could be serious injury or death.
- A tackle block system should be rigged by a qualified person as defined by ANSI/ASME B.30.
- Instruct workers to keep hands and body away from block sheaves and swivels - and away from "pinch points" where rope touches block parts or loads.
- Do not side load tackle blocks.
- See OSHA Rule 1926.550 (g) for Personnel Hoisting for Cranes and Derricks. Only a Crosby or McKissick Hook with a PL Latch attached, and secured with the bolt, nut and cotter pin provided, may be used for personnel hoisting. A hook with a Crosby SS-4055 Latch attached shall not be used for personnel hoisting.
- Instruct workers to be alert and to wear proper safety gear in areas where loads are moved or supported with tackle block systems.
- Read, understand, and follow these instructions to select, use and maintain tackle block systems.

Important

For maximum safety and efficiency, tackle block systems must be properly designed, used, and maintained. You must understand the use of tackle block components in the system. These instructions will assist you. Read them carefully and completely.

General Cautions or Warnings

Ratings shown are applicable only to new or "in as new" products.

Working Load Limit ratings indicate the greatest force or load a product can carry under usual environmental conditions. Shock loading and extraordinary conditions must be taken into account when selecting products for use in tackle block systems.

In general, the products displayed are used as parts of a system being employed to accomplish a task. Therefore, we can only recommend within the Working Load Limits, or other stated limitations, the use of products for this purpose.

The Working Load Limit or Design (Safety) Factor of each product may be affected by wear, misuse, overloading, corrosion, deformation, intentional alteration, and other

use conditions. Regular inspection must be conducted to determine whether use can be continued at the catalog assigned WLL, a reduced WLL, a reduced Design (Safety) Factor, or withdrawn from service.

These products generally are intended for tension or pull. Side loading must be avoided, as it exerts additional force or loading which the product is not designed to accommodate.

Always make sure the hook supports the load. The latch must never support the load.

Welding of load supporting parts or products can be hazardous. Knowledge of materials, heat treatment, and welding procedures is necessary for proper welding. WCS should be consulted for information.

Fitting Maintenance

Fittings, including hooks, overhaul balls, shackles, links, etc., may become worn and disfigured with use, corrosion, and abuse resulting in nicks, gouges, worn threads and bearings, sharp corners which produce additional stress conditions and reduce system load capacity.

Grinding is the recommended procedure to restore smooth surfaces. The maximum allowance for reduction of a product's original dimension due to wear or repair before removal from service is:

1. Any single direction - No more than 10% of original dimension.
2. Two directions - No more than 5% of each dimension.

Any greater reduction may necessitate a reduced Working Load Limit.

Any crack or deformation in a fitting is sufficient cause to withdraw the product from service.

Tackle Block Maintenance

Tackle Blocks must be regularly inspected, lubricated, and maintained for peak efficiency and extended usefulness.

Their proper use and maintenance is equal in importance to other mechanical equipment. The frequency of inspection and lubrication is dependent upon frequency and periods of use, environmental conditions, and the user's good judgment.

Inspection: As a minimum, the following points should be considered:

1. Wear on pins or axles, rope grooves, side plates, bushing or bearings, and fittings. Excessive wear may be a cause to replace parts or remove block from service.
2. Deformation in side plates, pins and axles, fitting attachment points, trunnions, etc. Deformation can be caused by abusive service and / or overload and may be cause to remove block from service.

3. Misalignment or wobble in sheaves.
4. Security of nuts, bolts, and other locking methods, especially after reassembly following a tear down inspection. Original securing method should be used; e.g., staking, set screw, cotter pin, cap screw.
5. Pins retained by snap rings should be checked for missing or loose rings.
6. Sheave pin nuts should be checked for proper positioning. Pins for tapered roller bearings should be tightened to remove all end play during sheave rotation. Pins for bronze bushing and straight roller bearing should have a running clearance of .031 inch per sheave of end play and should be adjusted accordingly.
7. Hook or shackle to swivel case clearance is set at .031 to .062 at the factory. Increased clearance can result from component wear. Clearance exceeding .12 to .18 should necessitate disassembly and further inspection.
8. Deformation or corrosion of hook and nut threads.
9. Surface condition and deformation of hook (See Fitting maintenance and ANSI B30.10)
10. Welded side plates for weld corrosion or weld cracking.
11. Hook latch for deformation, proper fit and operation.

Lubrication: The frequency of lubrication depends upon frequency and period of product use as well as environmental conditions, which are contingent upon the user's good judgment.

Assuming normal product use, the following schedule is suggested when using lithium base grease of medium consistency.

Sheave Bearings

Tapered Roller Bearings - Every 40 hours of continuous operation or every 30 days of intermittent operation.

Roller Bearings - Every 24 hours of continuous operation or every 14 days of intermittent operation.

Bronze Bushings - (Not Self Lubricated) - Every 8 hours of continuous operation or every 14 days of intermittent operation.

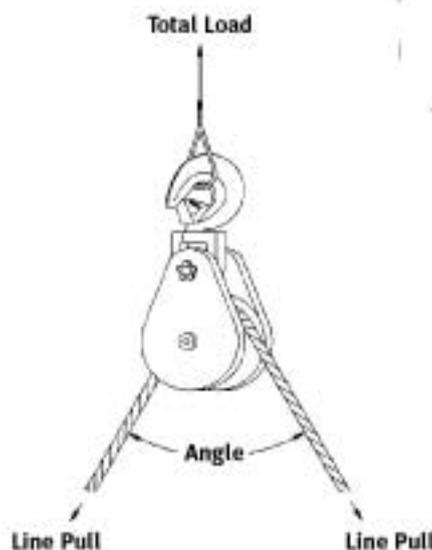

Hook Bearings

Anti Friction - Every 14 days for frequent swiveling; every 45 days for infrequent swiveling.

Bronze Thrust Bushing or No Bearing - Every 16 hours for frequent swiveling; every 21 days for infrequent swiveling.

Tackle Block Maintenance also depends upon proper block selection (see "Loads on Blocks"), proper reeving (see "The Reeving of Tackle Blocks"), consideration of shock loads, side loading, and other adverse conditions.

Loads on Blocks

The Working Load Limit (WLL) for blocks indicates the maximum load that should be exerted on the block and its connecting fitting.

This total load value may be different from the weight being lifted or pulled by a hoisting or hauling system. It is necessary to determine the total load being imposed on each block in the system to properly determine the rated capacity block to be used. A single sheave block used to change load line direction can be subjected to total loads greatly different from the weight being lifted or pulled. The total load value varies with the angle between the incoming and departing lines to the block.

The following chart indicates the factor to be multiplied by the line pull to obtain the total load on the block.

Example			
Angle Factor Multipliers			
Angle	Factor	Angle	Factor
0°	2.00	100°	1.29
10°	1.99	110°	1.15
20°	1.97	120°	1.00
30°	1.93	130°	.84
40°	1.87	135°	.76
45°	1.84	140°	.68
50°	1.81	150°	.52
60°	1.73	160°	.35
70°	1.64	170°	.17
80°	1.53	180°	.00
90°	1.41	-	-

Method of Reeving Manila and Wire Rope Blocks

The methods of reeving tackle blocks will vary with the applications and purpose for which they are to be employed; especially with heavy lift cargo booms, cranes and so forth, where blocks with four sheaves or more are required, in which case a number of lead blocks have to be considered. Our engineering department will be pleased to consult with you on this matter.

Method of Figuring "Parts of Line"

$$\frac{L}{P} = E$$

L = Load lifted in pounds

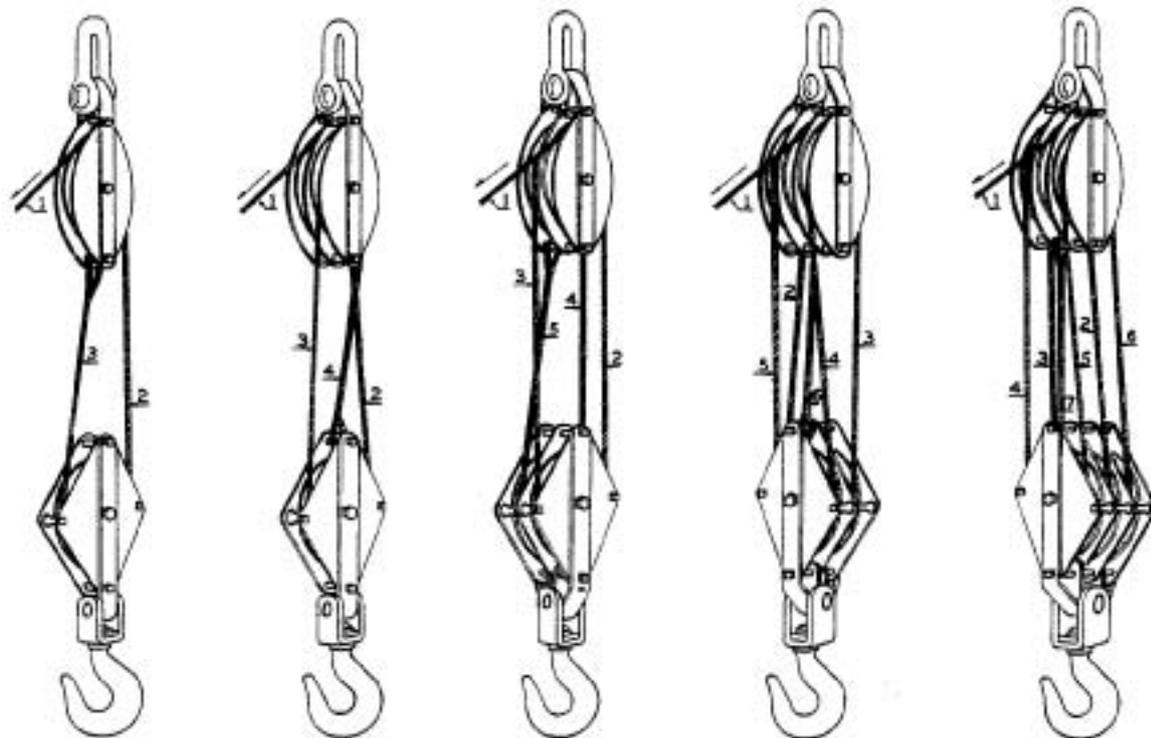

P = Line pull in pounds

E = Efficiency factor

For example: To figure "Parts of Line" required when load lifted "L" and line pull "P" are known.

$$\frac{32,000 \text{ lbs. (load lifted "L")}}{6,000 \text{ lbs. (line pull "P")}} = 5.3 \text{ ("E")}$$

You can see in the table below that an "E" factor of 5.3 required 6 "Parts of Line."

Parts of Line	1	2	3	4	5	6	7	8	9	10	11	12
"E" Factors												
Bronze												
Brushed	0.96	1.85	2.8	3.6	4.4	5.2	5.9	6.6	7.3	7.9	8.5	9.1
Roller												
Bearing	0.98	1.9	2.9	3.8	4.7	5.6	6.5	7.3	8.2	9.0	9.8	10.6

Western® Cargo Hoisting Blocks

SEE APPLICATION AND
WARNING INFORMATION
ON PAGE 162 – 163

E-566
With Drilled Swivel Eye

J-566
With Oblong Swivel Eye

- Block is galvanized.
- Block has flame-hardened roll forged sheave that assures greater wire life.
- Roll forged sheave is fitted closely into mortise of shell so wire cannot jam between sheave and shell.
- Available for 3/4" or 1" wire.
- Block is fitted with tapered roller bearings which take both load and side thrusts and hold sheave central so it cannot chafe or wear on the sides.
- Tapered Roller bearing with neoprene seals and stainless steel center pin, provide long life and trouble-free service.
- Stainless steel center pin has recessed nuts with lock washers.
- Swivel fitting has permanently sealed thrust bearing.
- Pressure lubrication fittings are standard on both center pin and swivel.
- Individually Proof Tested at 4 times Working Load or 2 times Resultant Load.
- The Working Load for Cargo hoisting blocks is the line pull.

- Forged steel swivel eyes.
- Hot Dip galvanized.
- 6" 453 - Pressed steel side plates with flared edges. Figure 8 grooved, self-lubricating bronze bushed sheaves, with pressure lube fittings. 453 has an extra wide throat opening to allow fittings to pass through.
- 6" 454 - Forged side plates designed to eliminate rope jamming. Wide throat opening and pressure lube fitting on sheave and eye fitting.
- 8" 454 - Forged steel side plates designed to eliminate possibility of rope jamming. Furnished with sealed tapered bearings. Flame hardened forged steel sheaves for wear resistance.

Sheave Diameter & Block No. (In)	Bearing Type	Working Load Limit* (Tons)	Weight Each (Lbs.)	Sheave Dimensions (In.)	
				Weight Diameter	Rim Thickness
6" F-453	Bronze Brushed	5	35	6	2-3/4
6" F-454	Needle Bearing	5	23	6	2-3/4
8" J-454	Tapered Bearing	10	36	8	2-7/8

* Ultimate Load is 4 times the Working Load Limit.

Skookum® Trawl Blocks

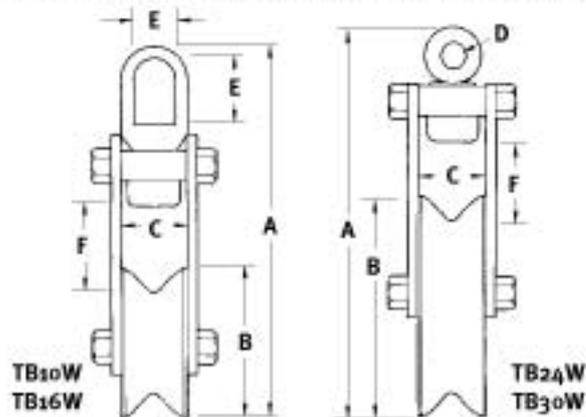

This is the ultimate quality in manufacture, engineering and design. The Skookum name is known worldwide – with 100 years experience in the block manufacturing business. The same engineering has gone into these new trawl blocks.

Check these quality/performance features:

- Timken Tapered Roller Bearings. Timken is the name synonymous with the best bearings you can buy. For strength. For long, long life. And the capacity to retain more lubricant for extended periods.
- Cast Manganese Steel Sheaves. Here again, the longest lasting material for the job. This manganese steel has work-hardening characteristics that make it extremely resistant to wire rope wear.
- Four popular sizes. Available in 10-ton (10" sheave) 25-ton (16" sheave), 50-ton (24" sheave), and 90-ton (30" sheave) for a choice to fit your fishing need.
- Made in the U.S.A. All materials are domestic. In addition to the finest quality, this means faster delivery and better availability. Skookum Trawl Blocks, service and parts are readily available through Skookum distributors.
- Skookum "Gold Standard" Alloy Shackles are available

option. This is the ultimate in metallurgical science – a special alloy steel of unmatched strength, hardness and durability.

- Hot Dip Galvanized. For a durable, corrosion resistant finish.
- Minimum Ultimate Work Load is 4 times the working load.

	Sheave	Capacity	A	B	C	D	E	F	Wt
Model TB10W Elongated Eye	10" diameter 5" wide	10-ton	25"	10"	5-3/8"	-	2-1/2" x 3-3/4"	5"	125
Model TB16W Elongated Eye	16" diameter 7" wide	25-ton	39"	16"	7-3/8"	-	3-3/4" x6	9"	370
Model TB24W Drilled Swivel Eye	24" diameter 7" wide	50-ton	43"	24"	7-3/8"	2-5/16"	-	7-3/8"	700
Model TB30W Drilled Swivel Eye	30" diameter 7" wide	90-ton	55"	30"	7-3/8"	3-3/8"	-	6"	1,250

All Models with Timken Tapered Roller Bearings and Timken Thrust Bearings. Designed to accept various wire and synthetic rope sizes.

Western® Wire Rope Blocks

Oval Pattern Construction Blocks

- All blocks are galvanized.
- Sheave lubricated through pressure lube fitting in center pin.
- Assembled with self-lubricated bronze bushing.
- Combines weight of regular oval blocks with strength of extra heavy oval blocks.
- Assembled with bolt type anchor shackle.
- Side plates are rounded to provide additional stiffness and reduce wear and chaffing of the rope.
- Extra rugged to meet marine applications

McKissick® Snatch Blocks

418
With Hook

419
With Shackle

404
Tailboard

- Forged alloy heat treated hooks.
- Forged steel swivel tees, yokes and shackles.
- Hook and shackle assemblies on 4-1/2" through 14" sizes can be interchanged.
- Can be furnished with bronze bushings or roller bearings.
- Opening feature permits insertion of rope while block is suspended from gin-pole.
- 3" thru 18" 418 and 419 blocks have exclusive bolt retaining spring to assure no lost bolts.
- Can be furnished with SS-4055 hook latch.
- Pressure lube fittings.

430
With Hook

431
With Shackle

407
Tailboard

- Drop forged, heat treated swivel hook or swivel shackle.
- Hook and shackle assemblies on 8" through 14" sizes can be interchanged.
- Can be furnished with bronze bushings or roller bearings.
- Pressure lube fittings.
- 8" thru 14" 430 and 431 blocks have exclusive bolt retaining spring to assure no lost bolts.
- Can be furnished with SS-4055 hook latch.
- Fatigue rated.
- 8" and 10" models furnished with dual rated wireline sheaves.

96	3	3.000	76.20	9	9.000	228.60 (22.86 cm)

*Generally used only for braided cordage.

PROPER USE AND CARE OF CORDAGE

AVOID OVERLOADING . . . The lower limit of the working load range should be used where life or limb is involved or for exceptional service conditions such as shock loads, sustained loads, etc. You should never exceed the listed working load range except as indicated above. If you rope is old or worn, you should make additional allowances to assure safety.

AVOID ABRASION . . . Out and inner rope fibers contribute equally to the strength of your rope. When worn, your rope is naturally weakened. Where it is necessary for a rope to rub over an object protect with chafing gear, such as canvass wrapped and tied around the rope.

AVOID SUDDEN STRAIN . . . Rope that is strong enough under a steady strain can be broken with a sudden jerk. Care when working with rope is extremely important.

AVOID KINKS . . . When rope is repeatedly turned or twisted in one direction, it is certain that kinks will develop, unless twists are repeatedly thrown in, or out of the rope. Pulling a kink through a restricted space such as a tackle block will seriously damage the rope fibers.

AVOID SHARP ANGLES . . . Sharp bends greatly affect the strength of a rope. Any sharp angle is a weak spot. Pad is for safety, and even then, Be Careful!

Continued on the next page

All About Cordage

REVERSE ENDS . . . Prolonged use, or wear, of one part of a rope will naturally decrease its effectiveness at that point. Occasionally reverse your rope, end-for-end, to distribute the wear more evenly. A good example is an anchor line aboard a boat.

AVOID CHEMICALS . . . Virtually all synthetic fiber ropes are resistant to damage from oil, gasoline, paint and most chemicals. To be on the safe side, however, keep your rope free of any type chemical. Natural fiber ropes are, of course, severely damaged by exposure to chemicals.

KEEP ROPE CLEAN . . . Dirt on the surface and imbedded in rope acts as an abrasive on fibers. When rope becomes dirty wash it thoroughly with clean water. Be sure to dry natural fiber ropes before storing.

AVOID IMPROPER STORAGE . . . Synthetic fiber ropes require no special storing conditions other than keeping them out of direct sunlight, away from the elements and out of extremely hot rooms. The ultra-violet rays of sunlight has a weakening effect on rope that is exposed for prolonged periods of time. Natural fiber ropes must, of course, be kept dry or they will rot in a very short time.

CORDAGE SPECIFICATIONS

NEW ROPE TENSILE STRENGTHS are based on tests of new and unused rope of standard construction in accordance with Cordage Institute Standard Test Methods. All figures are "Average" - The Minimum is 10% below stated amount. **WORKING LOAD LIMIT** is indicated by **RECOMMENDED WORKING LOAD RANGES. USE OF WORKING LOADS**—Because of the wide range of rope use, rope condition, exposure to the several factors affecting rope behavior, and the degree of risk to life and property involved, it is impossible to make blanket recommendations as to working loads. However, to provide guidelines, working loads are tabulated for rope in good condition with appropriate splices, in noncritical applications and under normal service conditions. **WORKING LOAD RANGES** should be exceeded only with expert knowledge of conditions and professional estimates of risks.

The **RECOMMENDED WORKING LOAD RANGES** are derived by taking 15 - 25% of **NEW ROPE TENSILE STRENGTH** for Braided Rope and 10 - 20% for Twisted Rope.

SYNTHETIC CORDAGE

Though initially more expensive than natural fiber ropes, synthetic ropes have proven to be more efficient and cost effective long term for most end uses. Man made fibered ropes are stronger and more durable. They are generally

not affected by rot or mildew or most chemicals, and may be stored wet or dry.

As a result, the service life of synthetics exceeds that of natural fiber ropes.

Each of the various types of Synthetic Fibers used in the manufacturing of rope and listed below, possesses different characteristics and properties. All of these fibers are continuous filaments of long molecular-chain polymers that extend the length of the rope. These filaments may be either extruded or spun, and are normally either termed as monofilament (larger single filaments) or multifilament (multiple smaller fibers).

NYLON: Due to its elasticity, nylon can absorb sudden shock loads that would break ropes of other fiber. It has very good resistance to abrasion and will last many times longer than natural fiber ropes. Nylon rope is resistant to rot, oils, gasoline, grease, marine growth or most chemicals.

POLYESTER: Polyester is very strong, but not quite as strong as nylon rope. The difference between the two ropes is that polyester does not have the stretch and elasticity of nylon but has better resistance to ultra-violet degradation from sunlight. Other than this, the characteristics of the two fibers are practically the same.

POLYPROPYLENE:* A lightweight, strong rope that is extensively used in many different ways. It is a floating rope and is resistant to rot, oils, gasoline or most chemicals and is waterproof. Polypropylene rope is available in monofilament fiber, which is smooth surfaced, or multifilament fiber, which has a somewhat velvety appearance and feel, and polypropylene film fiber which is produced in varying textures.

POLYETHYLENE:* One of the best known synthetic fiber ropes. A floating rope somewhat like polypropylene except that is just a little heavier. Also, polyethylene's handling characteristics are a little different than polypropylene. It is not quite as strong, size for size as polypropylene.

SYNTHETIC FIBER TYPES

MULTIFILAMENT: Soft, flexible, fine diameter, continuous strands. Available in nylon, polyester and polypropylene ropes only.

MONOFILAMENT: Extruded in round fibers. Not as soft as multifilament. Available in polypropylene and polyethylene ropes only.

SLIT FILM: Polypropylene or polyethylene is extruded in sheet film form then slit to make flat fibers.

SPUN: Very fine fibers with lengths of 1/2 to 1-1/2 inches

Continued on the next page

All About Cordage

are twisted into string then into rope. Available in cotton and polyester ropes only.

TEXTURIZED: Fibers are kinked to give loft to the fiber. Available in polyester, nylon and polypropylene.

COLOR: Natural color, in synthetic cordage, means white or silvery white obtained through the use of dyes and pigments.

COTTON CORDAGE

The primary advantages of cotton twines, sash cords, shade cords and rope are its good handling characteristics and knot holding ability. Cotton cordage is especially suited to specific uses, however, it does not have the strength or durability of the synthetic fibers.

ROPE CONSTRUCTIONS

TWISTED (LAID): Size for size, and pound for pound, twisted rope is the strongest and least expensive rope manufactured today. It is normally manufactured by twisting three strands, or bundles, of fibers in a spiral direction. It is spliceable.

SOLID BRAID: constructed with 9, 12 or 18 strands of fiber lock-stitched together. Has a very smooth surface with a firm, round cross-section that holds its shape under pressure and load. Excellent for use in pulleys, on winches, or anywhere that a firm, round rope is needed.

It is not spliceable.

MAYPOLE BRAID: Constructed with 8, 12 or 16 strands of fibers tightly braided around a center core of parallel fibers. It is generally not as round as solid braid, but tends to have a greater breaking strength. The strands form a herringbone pattern in the rope. It is not spliceable.

DIAMOND BRAID: Constructed with 8, 12 or 16 strands of fibers braided over and under each other in a circular direction. The center of the rope is hollow, allowing for easy splicing. Generally stronger than solid braid or maypole braid constructions. Easily and quickly spliced.

BRAID-ON-BRAID: Actually two ropes in one, with a jacket braided over a braided rope core. A very strong and flexible rope that doesn't kink, hockle or rotate under load. It is spliceable.

DEFINITIONS

BONDING: A coating of liquid to increase resistance to abrasion and prevent water absorption.

NATURAL: Natural color, unbleached cotton.

WHITE: In cotton, a specified color not to be confused with natural.

POLISHED (GLAZED): Cotton cordage that has been run through a gum and pigment polish to give it a high gloss.

PHYSICAL PROPERTIES OF FIBERS

Fiber Type	Specific Gravity	Sticking Temperature		Melting Temperature		Ultimate Elongation %
		°F	°C	°F	°C	
Nylon	1.34	455	235	482	250	25-35
Polyester	1.38	455	235	500	235	15-25
Polypropylene	.90	302	150	330	165	20-25
Polyethylene	.95	248	120	275	135	15-25
Cotton	1.54	-	-	Decomposes at 302	150	15-20

***SPECIAL NOTICE CONCERNING POLYPROPYLENE & POLYETHYLENE:** Polypropylene and Polyethylene are subject to deterioration when exposed to direct sunlight. These products were designed to give you many hours of use; however, the life of the product will be extended when stored away from sunlight. The product should be replaced when signs of excessive deterioration is indicated by discoloration, broken filaments, raveling, etc.

Rope Specifications

AVERAGE TENSILE STRENGTHS shown are for new (unused) rope and will decrease after use. All tests were performed in accordance with ASTM test method 4268-83.

The rope strength will be reduced after use due to heat, abrasion, ultraviolet or chemical exposure. The tensile strengths may be further reduced by up to 50% as a result of knots or kinks.

MINIMUM TENSILE STRENGTHS are defined as two standard deviations (typical about 15%) below the average and also refer only to new and unused ropes.

MAXIMUM WORKING LOADS are determined by dividing the average tensile strength by the safety factor. The safety factor is a function of the physical properties of the rope, the age and history of the rope, the type of service it will be subjected to and the risks involved if failure occurs. For a rope manufacturer to give blanket working load recommendations would be like a car manufacturer giving the "safe driving speed" of their cars.

Obviously the conditions of use far outweigh the design characteristics of the rope. Typically safety factors vary from 3:1 (for new rope used in applications with uniform loading and where failure would cause little or no risk to equipment or personnel) to 20:1 (for conditions involving moderate shock loading, possibility of snags or kinks or where failure could cause severe risk to equipment or personnel).

WORKING ELONGATION is shown from a preload tension of 200 times the diameter squared per the ASTM test specification.

ROPE WEIGHTS shown are average and may vary plus or minus 5%.

SPECIAL REQUIREMENTS

FACTORY SPLICING of various types is available for all of our ropes. Splices can be provided with various types of chafe protection or coatings.

CUSTOM LENGTHS and special constructions are available on request.

ROPE TERMINATIONS Washington Chain can provide custom terminations such as thimbles, links, rings and custom hardware. Terminations are available in plastic, bronze, stainless steel and galvanized steel. Please call or fax your requirements for a quotation.

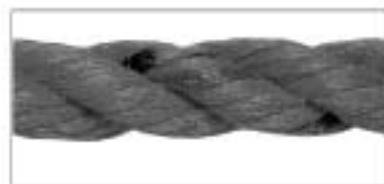

SPECIAL COATINGS such as polyurethane, polyethylene and vinyl esters may be applied to any of the synthetic ropes to improve the snag resistance, sunlight resistance or for color coding. WCS can provide ropes with a variety of finishes to meet your needs.

MILITARY SPECIFICATIONS Certificates of compliance are supplied at no charge if requested when placing the order. Certified test reports can be provided at an additional charge when requested at the time of the order.

Plasma[®] 12 Strand

Plasma[™] 12 strand is the highest strength synthetic rope available. Plasma[™] 12 strand is manufactured from AlliedSignal Spectra[®] Fiber that has been enhanced by Puget Sound Rope's patented recrystallization process. This process is especially effective in medium to large diameter ropes where strengths are over 50% higher and creep is significantly less than that of standard Spectra[®] 12 strand.

Plasma[™] 12 strand comes standard with a polyurethane finish and is easily spliced using a simple lockstitch type splice or 4-3-2 tuck splice. Its soft, torque free braided construction provides easy handling.

Tensile Strengths are determined in accordance with ASTM test method D 4268-83.

Weights are calculated at linear density under standard preload (200 d²) plus 4%.

- Highest strength
- Lowest stretch
- Low creep
- Soft hand
- Torque free
- Easy splicing
- Floats

Specific gravity	0.98
Melting point	284° F
Critical temp.	150° F
Coefficient of friction	0.09-0.12
Elongation at break	4% - 5%
Fiber water absorption	0%
UV resistance	excellent
Wet abrasion	superior
Dry abrasion	superior

Spectra[®] 12 Strand

Spectra[®] 12 strand provides very high strength, low stretch and excellent abrasion resistance in a single braid construction.

For the equivalent weight rope it is over 3 times as strong as polyester and has less than one half the elongation.

Spectra[®] 12 strand comes standard with a polyurethane finish and is easily spliced using a 4-3-2 tuck splice. Its soft, torque free braided construction provides easy handling.

Tensile Strengths are determined in accordance with ASTM test method 4268-83

Weights are calculated using the linear density under standard preload (200d²) plus 4%.

- Very Low stretch
- Very High strength
- Soft hand
- Torque free
- Easy splicing
- Floats

Specific gravity	0.98
Melting point	284° F
Critical temp.	150° F
Coefficient of friction	0.09-0.12
Elongation at break	6% - 8%
Fiber water absorption	0%
UV resistance	excellent
Wet abrasion	superior
Dry abrasion	superior

Polyester 12 Plait

Polyester 12 Plait provides high strength, low stretch and excellent abrasion resistance in a unique single braid construction.

Polyester 12 Plait is easily spliced using a standard tuck splice and is 30% stronger than three strand or 8 plait polyester. It's torque free braided construction provides easy handling and prevents kinks and hockles.

Polyester 12 Plait comes standard with an overlay marine finish and is available on special order with a spliceable polyurethane finish in clear or any of six colors.

Tensile Strengths are determined in accordance with ASTM test method D 4268-83

Weights are calculated at linear density under standard preload (200dF) plus 5%.

- Low stretch
- High strength
- Soft hand
- Torque free
- Easy splicing
- Meets MIL-R 24750

Specific gravity	1.38
Melting point	482° F
Critical temp.	350° F
Coefficient of friction	0.12-0.15
Elongation at break	15% - 20%
Fiber water absorption	0% - 1%
UV resistance	excellent
Wet abrasion	excellent
Dry abrasion	excellent

Nylon Double Braid

Nylon Double Braid is the preferred choice for applications requiring high strength with excellent shock absorbing properties. Nylon Double Braid has good resistance to abrasion, sunlight and chemicals. Due to its high elongation, nylon is almost always used in applications involving shock loading such as anchor lines and mooring lines.

Nylon Double Braid comes standard with an overlay marine finish and is available on special order with a spliceable polyurethane finish in clear or any of six colors.

- High stretch
- High strength
- Excellent shock absorption
- Soft hand
- Torque free
- Meets MIL-R 24050D

Specific gravity	1.14
Melting point	414° F
Critical temp.	300° F
Coefficient of friction	0.12-0.15
Elongation at break	30% - 35%
Fiber water absorption	3% - 5%
UV resistance	good
Wet abrasion	excellent
Dry abrasion	excellent

Polyester Double Braid

Polyester Double Braid provides an excellent combination of high strength, low stretch, excellent weathering and easy handling.

Of all the popular fibers polyester has the best weathering characteristics and the best wet abrasion resistance.

Polyester Double Braid comes standard with an overlay marine finish and is available on special order with a splicable polyurethane finish in clear or any of six colors.

- Low stretch
- High strength
- Soft hand
- Torque free
- Excellent wet strength
- Meets MIL-R 24677A

Specific gravity	1.38
Melting point	482° F
Critical temp.	350° F
Coefficient of friction	0.12-0.15
Elongation at break	15% - 20%
Fiber water absorption	0% - 1%
UV resistance	excellent
Wet abrasion	excellent
Dry abrasion	excellent

See specifications, page 179.

N/P Composite Double Braid

N/P Composite is a double braided rope with the inner core made of multifilament polypropylene and the outer sleeve of nylon.

N/P Composite combines the excellent sunlight and abrasion resistance of nylon with the flotation of polypropylene. It has a standard specific gravity of 1.01 and is available on special order with a specific gravity of 0.99.

N/P Composite Braid comes standard with an overlay marine finish and is available on special order with a splicable polyurethane finish in clear or any of six colors.

- Moderate stretch
- High strength
- Soft hand
- Torque free
- Floats in sea water

Specific gravity	1.01
Melting point	284° F

D/N Composite Double Braid See specifications, page 179.

D/N Composite is a double braided rope with the inner core made of nylon and the outer sleeve of polyester.

D/N Composite was designed for very specific applications and should be selected with extreme caution . . . although the rope has a higher tensile strength than either nylon or polyester, the strength gain comes at the expense of rope life.

D/N Composite Braid comes standard with an overlay marine finish and is available on special order with a spliceable polyurethane finish in clear or any of six colors.

- Moderate stretch
- High strength
- Soft hand
- Torque free

Specific gravity	1.26
Melting point	482° F

Spun Polyester Double Braid

Spun Polyester is a double braided rope with the inner core made of polyester continuous filament and the outer sleeve of DuPont type 77 Dacron® to give a soft easy-to-grip surface yet the strength of continuous filament polyester.

Spun polyester is easily spliced and has excellent weathering characteristics and abrasion resistance.

Spun Polyester Double Braid comes standard with an overlay marine finish.

- Low stretch
- High strength
- Very soft hand
- Torque free
- Excellent wet strength
- Meets MIL-R-24536

Splicing Instructions

Rope Terminology

BIGHT: A loop made in any part of a rope.

BITTER END: The end of a rope opposite the end in use.

BLOCK: Similar to a pulley. Used to give mechanical advantage when lifting or pulling heavy objects.

END: The end of a rope in use. (Opposite the bitter end).

FATHOM: A unit of measurement: 1 fathom is 6 feet.

FALL: The standing part of the rope coming from the fixed block on a block and tackle on which strain is applied.

LAY: The way a twisted rope is constructed. Lay is either right-hand or left-hand.

LINE: Rope used aboard boats and ships is called line.

PULLEY: A device consisting of a sheave mounted in a block or wall, which is used to achieve mechanical advantage when lifting or pulling heavy objects.

ROUND TURN: Two turns of rope around the object to which it is being fastened.

SHEAVE: Pronounced "shiv". The grooved wheel in a block or pulley upon which the rope rides when in use.

STANDING PART: The main part of the rope.

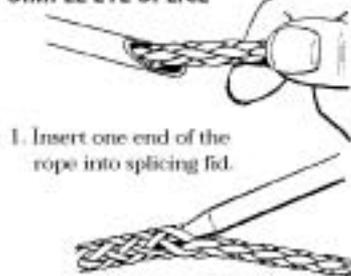

TURN: One turn of a rope around the object to which it is being fastened.

SPLICING DIAMOND BRAID ROPE

TOOLS NEEDED

All that is needed to splice Diamond Braid rope is a hollow splicing fid of the proper size. Each diameter rope requires a fid of the same size. All fids are marked with the rope diameter for which they are designed.

SIMPLE EYE SPICE

1. Insert one end of the rope into splicing fid.

2. Select point where splice is to begin. Insert tapered end of fid between the strands at this point.

3. As fid penetrates strands, guide the fid down the hollow center of the rope. In this step, push fid with right hand . . . at the same time use left hand to work the rope over the fid.

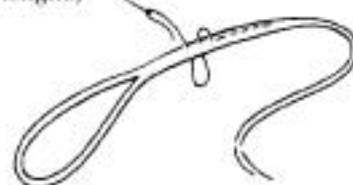

4. Six to eight inches below starting point, bring the fid out between two strands.

5. Remove fid from rope.

Tighten splice by pulling as indicated. (Caution: Completed splice section should measure at least six inches in length.)

6. For maximum security the splice should be stitched using a needle and heavy nylon polyethylene or polypropylene twine. If a needle is not available the fid may be used to lead the twine back and forth through the splice.

CROWN SPICE

Make small eye splice as explained in Simple Eye Splice. Steps 1-5. Pull end protruding from the splice until loop slides down flush with end of rope. Trim off protruding end.

EXPEDIENT EYE SPICE

1. Run end of rope through point where splice is to start.

2. Start splice two stitches above penetrating rope. Run fid through penetrating rope and continue down the hollow center for approximately six inches. Bring fid out through stitches. Remove from rope.

3. Tighten splice. Clip protruding end.

PERMANENT EYE SPICE 1

1. Cut approximately 2 ft. from one end of rope to be spliced. Put end B into splicing fid and insert it about 8 inches from one end of rope. Push fid 4 inches through center of rope and bring it out., leaving end approximately 4 inches long.

Note direction of splice in diagram!

2. Remove fid. Pull end B until eye is correct size.

3. Splice A into B as described in End-To-End splice.

4. Splice end B into original rope with an End-to-End splice.

Continued on the next page

Splicing Instructions (continued)

PERMANENT EYE SPLICE 2

1. Place splicing fid on end of rope, opposite to end where Eye splice is wanted. Insert fid through rope, about 6 inches from end, as shown.

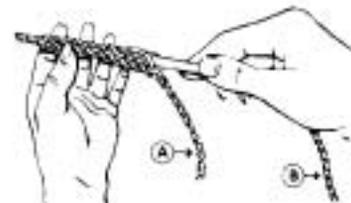

2. Remove fid and pull entire length of rope through to size of Eye splice desired.

3. Just below the point where rope comes through, (Arrow) insert fid into rope in direction away from loop, as illustrated. Insert short rope end into fid and guide fid down the hollow center of the rope. Push fid forward with right hand . . . at the same time use left hand to work rope over fid.

4. Five inches below starting point bring the fid out between two strands. Remove fid and pull protruding end to tighten the splice, then trim protruding end.

END-TO-END SPLICE

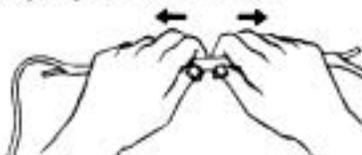

1. Splice rope B into rope A using principles described in EYE SPLICE. Steps 1-5.

2. At point where A overlaps B insert fid into rope B. Splice A into B.

3. Adjust splice so that A abuts B.

4. To tighten grasp splice firmly at center with thumb and forefinger of each hand . . . slide hands along rope as indicated by arrows. Clip any protruding ends.

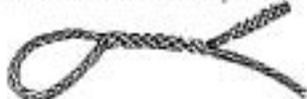

ADJUSTABLE EYE SPLICE

1. Insert rope into hollow end of splicing fid, then insert fid into rope at point about 24 inches from its end. As fid penetrates strands, guide it down the hollow center of the rope. In this step, push fid forward with right hand . . . at the same time use left hand to work the rope over the fid.

2. Bring the fid and rope out between two strands six to eight inches below starting point. Remove fid from rope.

3. Cap the protruding end with a Crown splice to prevent it from slipping back through the splice.
Eye size can be changed by adjusting the length of rope protruding from the splice.

SPlicing BRAID-ON-BRAID ROPE

TOOLS NEEDED

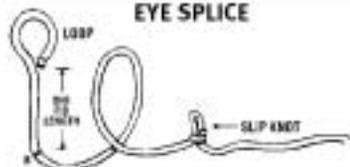

A FID . . . (B-Series) of the proper size. Braid-On-Braid splicing fids are identified with a "B" series number in addition to the rope diameter, size E, G, 3/8" (B-12) . . . 1/2" (B-16) . . . etc.

A PUSHER . . . Used for pushing rope and fid into rope when making a splice.

TAPE . . . Any type of tape is satisfactory as it is only used temporarily to prevent unraveling while making a splice.

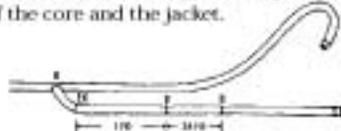

A MARKING DEVICE . . . Pencil, Dry Marker, Chalk or anything that will mark the rope being used.

EYE SPLICE

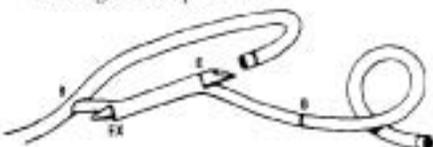

1. Form a loop the size of eye desired, then put a mark one fid length from the loop. This "B" (Base Point) is where you will extract the braided core from the braided jacket. It is important to make a slip knot approximately 5 feet from "B".

Using the pusher, part the strands of the jacket and pry out the core. Re-mark point "B" on the core where it comes out of the jacket. Now, using your fingers, pull the rest of the core out of the jacket. Tape the ends of the core and the jacket.

2. Grasp the core where it comes out of the jacket and slide jacket back until approximately 3/4 fid length is exposed. Mark this spot point "E" (Entrance). Slide jacket further back and mark point "EX" (Exit) one fid length from point "E".

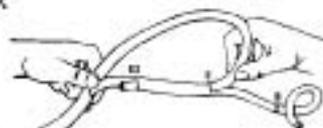

3. In this step you will pass the end of the jacket through the hollow core. Separate the strands of the core at point "E", insert fid, and slide it through . . . coming out of point "EX"

Continued on the next page

Splicing Instructions (continued)

4. Insert end of jacket into the socket of the fid. Hold the core lightly at "EX", then place the point of the pusher into the socket of the fid and push the fid and jacket through "E" to "EX" until end of jacket emerges at "EX".

5. Holding the core and end of the jacket tightly at "EX", smooth the braid of the core evenly from "EX" back to "E". Remove the tape from the end of the jacket sticking out at "EX". Pull the jacket carefully as shown, until the end disappears into the core.

6. The core must now be put back into the cover, finally emerging at point "B". Insert the fid into the jacket about 1/2 inch from "E". Place the end of the core into the fid, and use the pusher to slide fid and core through. Pull end of core until slack is taken out. You may not be able to push fid all the way to point "B" in one pass. If so bring out the point of fid between the strands of jacket and re-insert fid at the exact point where you brought it out and push it through the rest of the way, coming out at "B".

7. Grasp rope at point "E" and smooth down both sides of loop. Now, hold rope at slip knot, and with the other hand slide the jacket toward the splice. Repeat this action until exposed core is hidden inside jacket, and all slack in jacket has been removed. If bunching occurs at point "E" pull firmly on tail of core until it disappears. With this complete, smooth loop until all slack is removed and cut off tail near jacket. End will disappear by further smoothing of the loop. Untie the slip knot and your eye splice is completed.

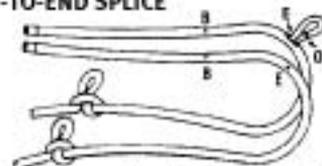

CROWN SPLICE

A crown splice will keep a line from fraying and unraveling. This is made similar to the eye splice with the following variations:

1. In Step 1, do not measure any loop, just measure one fid length from the end of the line to get point "B". Be sure to tie a slip knot.
2. Steps 2 thru 5 are the same.
3. After cover has been inserted in core, proceed to Step 7, and bury core in the jacket. Cut off tail of core flush with end of splice.

END-TO-END SPLICE

1. Place ropes to be spliced side by side and mark point "B" (Base point) one fid length from the end of each rope. Mark point "E" about 2/3 a fid length from point "B". Make certain that both ropes are marked identically. Tie a slip knot about 5 feet from point "E" in each rope.

Using the pusher, part the jacket strands at point "E" and extract the core. Tape the ends of both jackets and extracted cores.

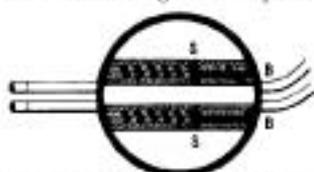

Mark point "O" on each core where it comes out of the jacket.

2. Mark both cores as follows:

Hold core at point "O" and slide jacket back about 2/3 a fid length. Mark point "A".

Hold core at point "A" and slide jacket back about 1-2/3 fid lengths. Mark point "C".

3. It is necessary to taper the jacket to prevent bulge in the crossover. Do this to both ropes as follows.

Starting at point "B" count 7 adjacent pairs of strands and mark point "S". From this point count, and mark every other intersecting pair of strands (see illustration). 7 intersecting pairs are to be marked.

Remove the tape from the jacket end and beginning with the marked intersecting

strands nearest the jacket end, cut the marked strands only and pull them from the jacket. DO NOT CUT BEYOND POINT "S". Tape end of tapered jacket.

4. Place the ropes end to end with the jacket of each beside the extracted core of the other. Insert the end of one jacket into the fid socket. Insert the fid at point "A" on the other rope core. With the pusher, push the fid through the center of the core and bring it out at point "C". Pull the jacket through the core till point "S" on the jacket meets point "A" on the core. Repeat this procedure with the other jacket and core.

5. Insert taped end of one core into the fid socket. Insert fid at point "S" on the other rope jacket. With the pusher, push fid through the center of the jacket and bring it out at point "E". Repeat this procedure with the other core and jacket.

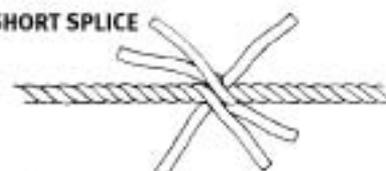

6. Remove tape from jacket ends and pull crossover snug by pulling jacket and core simultaneously on each side of splice. Hold the crossover firmly and smooth excess braid away from it in both directions. Cut off protruding cores at point "E".

7. Hold rope at the slip knot with one hand and with your other hand, slide the jacket toward the splice. Repeat with other rope. Do this until all slack has been removed between the slip knots and the length of the opening in the splice is about equal to the rope's diameter.

SPlicing 3-STRAND TWISTED ROPE

SHORT SPLICE

1. For end-to-end splicing of two ropes, first, unlay both ropes for a short distance and bring them together so that the main bod

Continued on the next page

Splicing Instructions (continued)

ies of the ropes fit snugly and the unlaidd strands mesh, alternating a strand of one with a strand of the other. Sealing the strand ends of synthetic fiber ropes with a flame or hot knife will prevent their unraveling.

It is helpful to temporarily tie the strands of one rope to the body of the other rope.

2. Now, tuck one of the unlaidd strands over and under a strand of the opposite rope, working against the twist.

Take the unlaidd strand next to the strand just tucked, and tuck it over and under the next strand in the opposite rope. Do the same thing with the remaining unlaidd strand. Now, take one more truck with each strand.

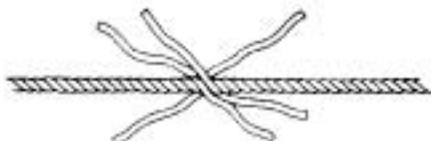

3. Remove the temporary tie and make two tucks with the other three strands. You now have the strands of each rope tucked two times through the strands of the other rope. Now go back and make at least two more tucks with each of the six strands . . . four additional tucks are recommended for synthetic ropes.

4. Roll the splice under your foot, or a board and clip off ends of the protruding strands.

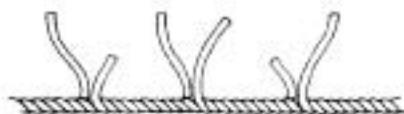

CAUTION: Do not clip ends too close to the splice.

LONG SPLICE

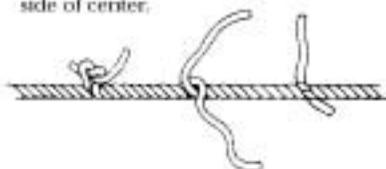

The Long splice is not quite as strong as the Short splice, but it permits a rope to run freely through a block or pulley.

1. To make a Long splice, unlay the end of each rope about 14 turns and bring them together so that the main bodies of the ropes fit snugly and the unlaidd strands mesh: alternating a strand of one with a strand of the other. Sealing strand ends of synthetic fiber ropes with a flame or hot knife will prevent their unraveling.

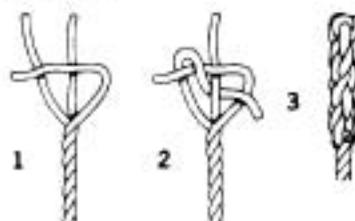

2. Starting with any opposite pair, unlay one strand and replace it with its opposite strand from the other rope. Do the same thing with another pair of strands, going in the opposite direction. You now have two long opposing strands in the center, at the original meeting point of the two ropes, and a pair of long and short opposing strands on each side of center.

3. Now tie each pair of opposing strands tightly with an overhand knot, tuck each strand twice back into the rope, going against the twist. Roll the splice under your foot or a board, clip protruding strand ends and your splice is complete.

CAUTION: Do not clip ends too close to the splice.

CROWN SPLICE

When you want a rope end to be a little larger in diameter than the rope, and have a finished appearance, the Crown Splice is the answer.

1. Unlay the end of your rope, (sealing the strand ends of synthetic fiber rope will prevent them from unraveling) and lay the right hand strand across the other two as illustrated.
2. Then tuck the left hand strand over the first strand, then back over the right hand strand.
3. Pull all strands snug, then tuck them in sequence over and under the strands in the main body of the rope, as in a short splice. Roll the splice under your foot or with a board, and clip protruding ends, not too close to the rope.

CAUTION: Do not clip ends too close to the splice.

EYE SPLICE

The Eye Splice may be made as a loop of any size or it can be made tight around a metal thimble to prevent chafing of the rope fibers.

1. To begin your Eye Splice unlay the strands for a short distance and double back to form a loop of the desired size, with the unlaidd strands laying across the twist of the rope.

Sealing strand ends of synthetic fiber rope will prevent them from unraveling.

Tuck the center unlaidd strand under any one of the strands in the main body of the rope, going against the twist.

2. The next unlaidd strand going over the strand under which the center unlaidd strand is tucked, and is tucked under the next strand in the rope.

3. Tuck the last unlaidd strand under the remaining strand in the rope, making sure the tuck is against the twist.

4. Pull each strand snugly up to the main body of the rope then tuck them, in sequence, over and under the strands in the rope. While it is traditional to use 4 tucks, at least 6 tucks are recommended for synthetic fiber ropes.

Roll the splice under your foot or a board, and trim protruding strand ends, not too closely to rope. Your splice is complete.

Splicing Fids • For Diamond Braid Rope

All that's needed for instant, easy splicing of Diamond Braid ropes is a fid of the proper diameter for the rope.

Rope Dia. (In.)
3/16
1/4
5/16
3/8
1/2
5/8

NOTE: The 5/8 in. fid is also used for splicing 3/4 in.

Rope Measurer

Rope Measurer

Meets National Bureau of Standards H-44 Requirements.

Accurately measures cordage, from 5/32 to 3/4 inch diameter, within Weights and Measures tolerances. Digital counter indicates feet and inches up to 99 feet 11 inches and continues. Also subtracts. Rates at 1,000 feet per minute.

Cutting Gun

Electronic Cutting Gun

A handy tool that cuts and seals the ends of synthetic ropes in one fast movement. 120 Volts A.C., 60 cycle, 1.1 amps., 130 watts. 5 foot cord.

Knot & Splicing Instruction Book

A comprehensive 70-page book containing a world of information about rope and its uses. 139 illustrations with easy-to-follow instructions. How to tie knots and hitches. How to splice braided and twisted ropes. How to make things with rope and much more.

Synthetic Slings

Types 1-6, 1 and 2 ply	192
Roundsling	195
Evaluating Wear	196

Washington Chain has on hand a solid inventory of synthetic slings. We will be pleased to have custom fabricated anything we do not carry.

SLING LOAD CHART

All Angles Measured from Vertical
(1,000 lbs. Load)

EXAMPLE:

This chart illustrates how the stress on a sling increases as the angle increases (all angles measured from the vertical).

When one sling leg lifts 1,000 lbs. at 0 degrees, the sling stress is also 1,000 lbs. If the sling angle is increased to 45 degrees, the stress actually exerted on the sling would be 1,414 lbs., an increase of 41.4%.

Should the sling angle be increased to 60, the stress would be 2,000 lbs., or a 100% increase. At an 85° angle (extremely unlikely) sling stress increases 1,047%. With a load of 1,000 lbs. the sling stress would be 11,473 pounds.

Sling charts show rated capacity in lbs. with a safety factor of 5. For a higher safety factor select the next larger sling. However, it is important that you check in the column showing sling angle that most nearly corresponds with the maximum angle at which you will hoist.

SHOWING SLING STRESSES AT VARIOUS ANGLES

VERTICAL ANGLE	HORIZONTAL ANGLE	EQUIVALENT VERTICAL LOAD ON ONE LEG (LBS.)	INCREASE IN STRESS DUE TO SLING ANGLE	TOTAL SLING STRESS (LBS.)
90°	0°	1,000		
85°	5°	1,000	1047%	11,473
80°	10°	1,000	476%	5,759
75°	15°	1,000	286%	3,863
70°	20°	1,000	192%	2,924
65°	25°	1,000	136%	2,366
60°	30°	1,000	100%	2,000
55°	35°	1,000	74.3%	1,743
50°	40°	1,000	55.5%	1,555
45°	45°	1,000	41.4%	1,414
40°	50°	1,000	30.5%	1,305
35°	55°	1,000	22.0%	1,220
30°	60°	1,000	15.4%	1,154
25°	65°	1,000	10.3%	1,103
20°	70°	1,000	6.4%	1,064
15°	75°	1,000	3.5%	1,035
10°	80°	1,000	1.5%	1,015
5°	85°	1,000	0.3%	1,003
0°	90°	1,000	0%	1,000

HOW TO SELECT A SLING FOR USE AT ANY ANGLE When calculating for selection of proper sling for use at any angle, select vertical angle in chart above, read the 'increase in stress' as a percentage factor. Multiply the actual load weight by this percentage, then add answer to actual load to be hoisted. This gives Rated Capacity to look for in selecting proper size of sling.

Olympic Roundsling Features

The OLYMPIC Roundsling is a major advancement in securing almost any object to be pulled or lifted. It consists of a continuous, or endless, loop of 100% polyester fiber as shown in the cutaway at "A".

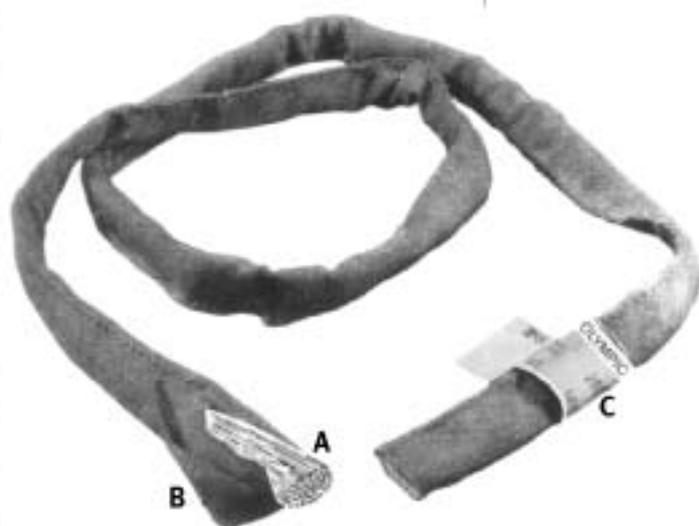

The accumulation of numerous fiber strands determines the strength factor, as the capacity chart below shows.

The multiple fiber construction makes the roundsling soft and flexible — perfect for a choked lift. The sling contours itself around the load.

The bundle of fibers is protected by a double cover of woven polyester fabric, as shown at "B" in cutaway. Because the load bearing fibers never come in contact with the load, there is no wear to them as long as the cover remains intact. In addition, the endless roundsling can be constantly rotated, further extending the wear life of the protective covering and the sling as a whole.

Load drop safety is inherent in the polyester fiber principle. Even if the sling is greatly overstressed, it will not completely break apart at once, it will stretch slowly as the individual fibers start to break, allowing time to put the load down.

Each sling has a tough, branded leather label permanently attached, with load capacities marked, as shown at "C". The ultimate breaking load is minimum of five times the rated capacity.

- Melting point 500° F (260° C)
- Max. working temp. 200° F (100° C)
- Excellent resistance to ultra violet rays, rot and mildew
- Lightweight, easy to handle, store and clean
- No loss of strength in water
- Only 3% elongation
- Protects workers' hands
- Resistant to acids
- Not resistant to heavy concentrations of alkalis
- Non-Sewn edge on cover, solid tube construction.

Testing: OLYMPIC Roundslings are quality control tested for tensile strength in straight pull and choked; also for elasticity.

Evaluating Worn Synthetic Web Slings

To the cautious sling user, many good and still operable slings have been thrown away because of the appearance of the 'red wear indicator' on the body of the sling; and in other cases, its rejection has been justified.

The first consideration should be to evaluate the nature and cause of the worn section and its severity.

Is the wear due to dragging the sling and rupturing its selvaged edge?

This is a common situation on production type small boat lifting or other similar operations where the sling is repeatedly dragged over a black top or rough concrete surface.

Selvaged edge wear is progressive and should be shown immediate attention. A piece of thin Cordura webbing can be sewn around the fraying edge bringing the sling back to 100% efficiency. If ignored, the fray will progressively travel into the body of the sling leaving only the tensile strength of the 'gut' members to carry the load. It will also create an unbalanced condition when lifting; throwing most of the load on that portion of the sling that is not frayed. If the frayed part has progressed over 1/4 of the slings width, we would consider this sling unrepairable and it should not be used.

Has the sling been physically cut or sliced by a sharp object?

The usual cause is carelessness; i.e., run over by trucks or forklifts, dropping metal plate or other heavy objects on the sling, etc...

Bear in mind that most sling type webbing carry about 80% of their ultimate tensile strength in the longitudinal gut members and about 20% in the 'pick threads or warp' (the threads that travel across the width of the webbing holding the 'gut' tensile members in a flat plane). If the cut or slice is shallow and does not involve the gut members, the sling is worth repairing. Punctures can be repaired.

Sharp corner abrasion or scrape condition.

This condition is usually created by lifting a 'sharp' corner or angular load with slings whose tensile strength is too low and/or sufficient dunnage has not been used between the sling body and sharp corner. We are referring to loads such as pallets, boxes, lumber and any load other than a round or radii configuration.

Another cause is 'jerking' or lifting a load too fast. Other than its strength, synthetic webbing's greatest attribute is its shock absorbing stretch ability. If an angular load is lifted too fast, this load under a loaded condition around a sharp corner may momentarily work up a 'friction temperature' great enough to fuse the webbing surface and partially destroy the original tensile strength of the webbing.

Usually, this type of abrasion takes place across the full width of the sling and we do not recommend repair.

Push-Pull Ratchets

If ratchets do not meet your needs, here's how you can tailor a ratchet for your own application.

Beginning with the plain threaded barrel, choose the diameter to provide the strength you need and the length for the takeup you require.

Next, decide which of the five handles shown applies best. Then select by name the two end fittings from the eleven types shown.

Select the amount of work load in pounds or tons you anticipate and the number of ratchets needed. We will send you a quotation promptly.

Chain Hoists

Jet L-90 Chain Hoists

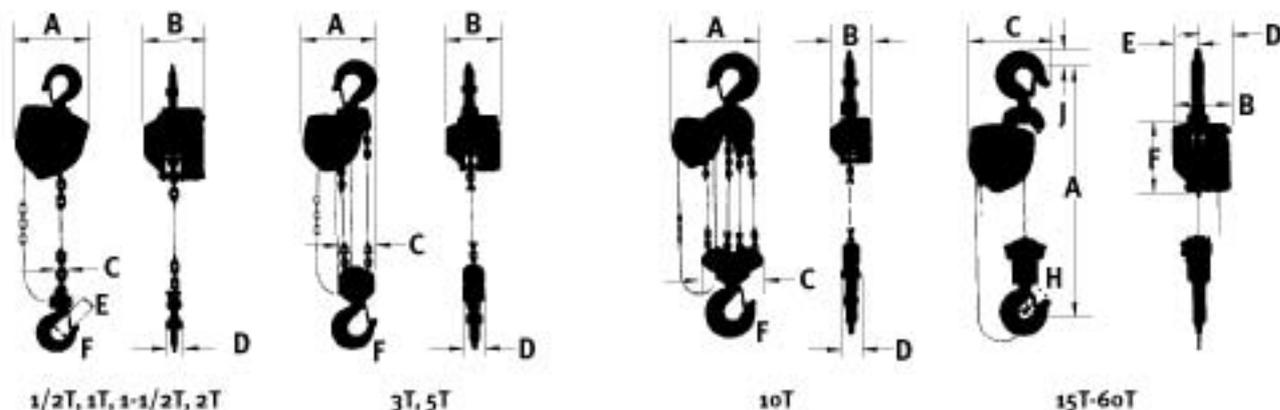

- Lightweight steel construction
- Less distance between hooks makes it ideal for hoisting in close quarters and low ceiling applications
- Housing, sheaves and frame are all steel
- A rolled edge on the hand wheel cover acts as a chain guide and allows smooth operation even when pulling the hand chain at an angle
- Handwheel cover prevents dirt and dust from hampering operation
- Electrostatic powder painted before assembly to protect against rust and corrosion
- Gear case has four reinforced ribs and four knock pins
- Gears are chrome molybdenum steel
- Equipped with anchor plate to avoid over lifting/lowering
- Positive ratchet, screw and disc brake are completely enclosed to protect the brake mechanism
- Non-asbestos brake discs made of low-abrasion Aramid fiber
- Chain is heat treated, low-wear hoisting chain, surpassing ISO T-class

- Top and bottom safety hooks are standard.
- Heat treated, carbon steel, drop-forged hooks are designed to bend slowly to warn of overloads
- Meets OSHA and ANSI B30.16 standards
- Tested and certified to 125% of rated capacity

CAUTION: Be sure that supporting structures and load attaching devices used in conjunction with this hoist provide an adequate safety factor to handle the rated load plus the weight of the equipment. If in doubt, consult a qualified structural engineer. This equipment is not to be used for lifting, supporting or transporting people, or lifting or supporting loads over people.

IMPORTANT: Before installation, see maintenance and operations manual for additional warnings and precautions. Not for use in explosive environment.

NOTE: Custom lifts are available in any length desire. However, custom lift hoists are not returnable.

Jet Pullers

- Size and weight of pullers allow easy handling and operation
- Choice of steel or aluminum alloy housings
- Simple design makes routine inspection or maintenance fast and easy
- Direction of pull controlled with one flip of the self-locking thumb lever
- High tensile steel plate housing
- Key parts are magnafluxed and inspected before assembly
- Needle bearings provide smooth operation and long life
- Braking mechanism has increased gear ratio to reduce pressure force between 26.4% and 52.5% providing increased safety and reliability of brake
- Low wear chain is strong and smooth finished to prevent snagging or jamming
- Gauge included to check for chain elongation and hook opening
- Drop-forged hooks are designed to bend slowly to warn of overloads
- Top and bottom safety hooks are standard
- Meets OSHA and ANSI-ASME HST-3M standards
- Each unit is tested and certified to 125% of rated capacity

CAUTION: Be sure supporting structures and load attaching devices used in conjunction with this puller provide an adequate safety factor to handle the rated load plus the weight of the equipment. If in doubt, consult a qualified structural engineer. This equipment is not to be used for lifting, supporting or transporting people, or lifting or supporting loads over people.

IMPORTANT: Before installation, see maintenance and operations manual for additional warning and precautions. Not for use in explosive environment.

Jet JP Series Pullers

- Size and weight of pullers allow easy handling and operation
- Main frame made of high tensile strength steel
- Simple design makes routine inspection or maintenance fast and easy
- Direction of pull controlled with one flip of the self-locking thumb lever
- Key parts are magnafluxed and inspected before assembly
- Needle bearings provide smooth operation and long life
- Braking mechanism has increased gear ratio to reduce pressure force between 26.4% and 52.5% providing increased safety and reliability of brake
- Grade 100, high strength, low-wear chain is abrasion resistant to prevent snagging or jamming
- Non-asbestos brake discs made of low-abrasion Aramid fiber
- Gauge included to check for chain elongation and hook opening
- Drop-forged hooks are designed to bend slowly to warn of overloads
- Top and bottom safety hooks are standard
- Meets OSHA and ANSI-ASME HST-3M standards
- Each unit is tested and certified to 125% of rated capacity

CAUTION: Be sure supporting structures and load-attaching devices used in conjunction with this puller provide an adequate safety factor to handle the rated load plus the weight of the equipment. If in doubt, consult a qualified structural engineer. This equipment is not to be used for lifting, supporting or transporting people, or lifting or supporting loads over people.

IMPORTANT: Before installation, see maintenance and operations manual for additional warning and precautions. Not for use in explosive environment.

NOTE: Custom lifts are available in any length desired. However, custom lift pullers are not returnable.

Jet Mini-Mite Pullers

- Lightweight and rigid design
- Super Hardened chain
- Electrostatic powder painted before assembly to protect against rust and corrosion
- Reinforced gear cover protects pivotal gear block
- Extra strong handle
- Non-asbestos brake discs made of low-abrasion Aramid fiber
- Double action ratchet works even without a load
- Top and bottom safety hooks are drop-forged and designed to bend slowly to warn of overloads
- Meets OSHA and ANSI-ASME HST-3M standards
- Each unit is tested and certified to 125% of rated capacity

CAUTION: Be sure supporting structures and load-attaching devices used in conjunction with this puller provide an adequate safety factor to handle the rated load plus the weight of the equipment. If in doubt, consult a qualified structural engineer. This equipment is not to be used for lifting, supporting or transporting people, or lifting or supporting loads over people.

IMPORTANT: Before installation, see maintenance and operations manual for additional warning and precautions. Not for use in explosive environment.

Jet Pullers

Jet Cable Pullers

- All steel construction
- Two laminated ratchet wheels for added strength and security
- Concealed spring-lever control to prevent accidental release
- Lightweight with sure grip handle
- Safety latches are standard on both hooks
- Two ratchets ensure positive stops
- Snatch block included with JCP-2

Model	Max. Lift (ft.)	Cap'y	Wire Rope Dia. (in.)	Net Lbs.
JCP-1	12	1 Ton	3/16	7
JCP-2	5	2 Ton	3/16	8

Note: Not for use in explosive environment.

Jet Grip Pullers

- May be used in any position to lift, pull, lower or stretch heavy loads
- Operated manually by engaging clutch and working the handle
- Uses standard ASA wire rope
- 66 feet of wire rope comes standard
- Longer length wire rope may be used with pulley blocks
- Shear pins in the handle will break under severe overload. Extra pins are provided and are easily installed.
- Safety latches are standard.

Model	Pulling Cap'y (Lbs.)	Lifting Cap'y (Lbs.)	Handle Length (in.)	Dimensions			Wire Rope Dia. (in.)	Net Lbs.

Note: Not for use in explosive environment.

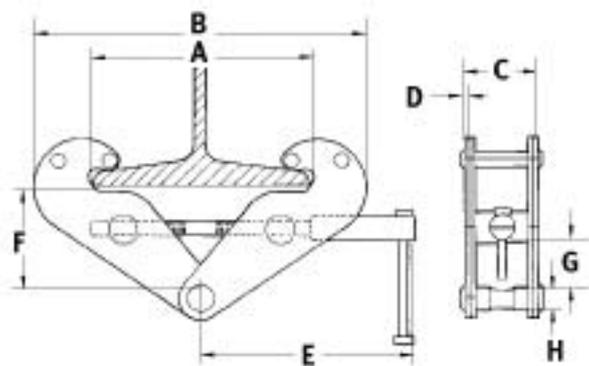

Jet Beam Clamps

- Clamp jaw is designed to reduce flange stress by distributing load away from I-beam flange edge
- Can be mounted easily with threaded handle
- Fits a wide range of flange widths and beams
- Suspension bar provides lower headroom

Model	Rated Load Lbs.	Flange Width (in.)	Net Lbs.

Jet Manual Adjustable Trolleys

Type MBT-Ball Bearing

- MBT series feature double sealed ball bearings
- Use on straight or curved track
- Can be installed on removed at any point along the track
- Adjustable to fit various size wide flange and I-Beams
- Built-in bumper guards
- Can be used with H and I-Beams

MBT Type Trolleys

Jet Manual Adjustable Trolleys

Type GBT-Geared with Ball Bearings

- Geared drive wheels with ball bearings
- Use on straight or curved track
- Can be installed or removed at any point along the track
- Adjustable to fit various size wide flange and I-Beams
- Extra lifts available
- Built-in bumper guards
- Manufactured for use with wide flange and I-Beams

General Cautions and Warnings

All products contained herein are sold with the express understanding that the purchaser is thoroughly familiar with the safe and proper use and application of the product.

Responsibility for use and application of the product rests with the user.

Failure of the product can occur due to misapplication, abuse, or improper maintenance. Product failure could allow the load to become out of control, resulting in possible property damage, personal injury or death.

There are numerous government and industry standards that cover these products. The catalog makes no attempt to reference all of them. We do reference the standards that are most frequently asked about.

Ratings shown are applicable to only new or "in as new" condition products.

Load Limit ratings indicate the greatest force or load a product can carry under usual environmental conditions. Shock loading and extraordinary conditions must be taken into account when selecting products for use in a system.

In general, the products displayed in WCS literature are used as parts of a system being employed to accomplish a task. Therefore, we can only recommend within the Working Load Limits, or other stated limitations, the use of products for this purpose.

The Working Load Limit, or Design Factor, or Efficiency Rating of each product may be affected by wear, misuse, overloading, corrosion, deformation, intentional alteration, and other use conditions. Regular inspection must be conducted to determine whether use can be continued at the catalog assigned WLL, a reduced WLL, or whether the product must be withdrawn from service.

Most products generally are intended for tension or pull. Side loading must be avoided, as it exerts additional force or loading which the product is not designed to accommodate.

Welding load support parts or products can be hazardous. Knowledge of materials, heat treatment, and welding procedures are necessary for proper welding.

The assigned Ultimate Load Rating for the reeving of wire, manila, or synthetic rope is based upon design; the catalog ultimate strength for the rope parts, when totaled, may exceed the assigned Ultimate Load Rating.

The Working Load Limit of a sling must not exceed the lowest Working Load Limit of the components in the system.

The recommended Proof Load on all items in this catalog is two times the Working Load Limit unless otherwise shown.

All products are to be considered as sparking unless otherwise noted.
